who have profoundly  
influenced my life**

# Declaration

We hereby declare that the thesis entitled “ Study on modular lattice and Boolean algebra ” submitted for the partial fulfillment for the Master of Philosophy degree is done by the student ( Roll No. M.Phil 0051507 , Session 2000-2001 ) himself and is not submitted elsewhere for any other degree or diploma .

 15/6/08 .  
Supervisor

Professor Dr.Md. Bazlar Rahman

Department of Mathematics

Khulna University of Engineering & Technology

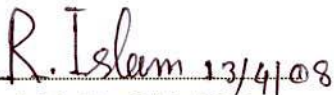

Khulna – 920300.

## ACKNOWLEDGEMENTS

At first I offer my profuse gratitude to Almighty Allah Who has given me the strength , vigor and courage to accomplish my thesis successfully . I would like to express my heartfelt thanks and reverence to my supervisor Professor Dr. Bazlar Rahman , Department of Mathematics , Khulna University of Engineering and Technology ( KUET ), for his constant guidance, suggestions, criticism and encouragement during my research work for the preparation of this thesis.

My spouse and off springs deserve appreciation since they acted as a perennial source of inspiration . Despite my preoccupation with the thesis they did their best to keep everything functional . I will do injustice to my colleagues if I do not mention the invaluable assistance and cooperation extended by them in times of need .

I am also thankful to all the members in the department of Mathematics , Khulna University of Engineering and Technology ( KUET ) for extending me co-operation and encouragement during my research work .

  
Md. Rashidul Islam

This thesis studies extensively the nature of modular lattices and Boolean algebras. The modular lattices have been study by several authors including Abbott [ 2 ], Birkhoff [ 3 ] and Rutherford [ 19 ]. A poset is said to form a lattice if for every  $a, b \in L$ ,  $a \vee b$  and  $a \wedge b$  exists in  $L$ , where  $\vee, \wedge$  are two binary operation .A lattice  $L$  is called modular lattice if for all  $a, b, c \in L$  with  $a \geq b$ ,  $a \wedge (b \vee c) = [ b \vee ( a \wedge c ) ]$ . In this thesis we give several results on modular lattices which certainly extend and generalized many result in lattice theory .

In chapter one we discuss ideals , complete lattices , relatively complemented lattices and other results on lattices which are basic to this thesis . If every interval in a lattice is complemented the lattice is said to be relatively complemented .

Chapter two discusses Embeddings , Kernels and dual homomorphisms . If  $L, M$  be two lattices , a one-one homomorphism  $\theta : L \longrightarrow M$  is called an embedding mapping . Also in that case we say  $L$  is embedded in  $M$  . We prove that the definition of dual meet homomorphism and dual join homomorphism are equivalent .

In chapter three we discuss on modular lattices and distributive lattices . Distributive lattices have been studied by sever author including Cignoli [ 4 ], Cornish [ 5 ], Cornish and Hicman [ 6 ] and Evans [ 7 ], Nieminen [ 15 ], [ 16 ] . Hence we prove a lattice  $L$  is distributive if and only if

$$(a \vee b) \wedge (b \vee c) \wedge (c \vee a) = (a \wedge b) \vee (b \wedge c) \vee (c \wedge a)$$

$$\forall a, b, c \in L$$

In chapter four we discuss Boolean algebras and Boolean functions . Previously Boolean algebras , Disjunctive Normal forms and Conjunctive Normal forms have studied by Abbott [ 1 ] . Here we extend several

---

result on Boolean Algebras and also find the DN form of the function whose CN form is

$$f = (x \vee y \vee z) \wedge (x \vee y \vee z') \wedge (x \vee y' \vee z) \wedge (x \vee y' \vee z') \wedge (x' \vee y \vee z).$$

---

**“Lattices , Sublattices and Complete lattices ”**

**1.1 Introduction**

In this chapter we discuss Ideals , Complete lattices and Relatively Complemented lattices .Complete lattices and semilattices have been studied by several authors Papert [ 18 ] , Rozen [ 20 ] , Varlet [ 22 ] . A lattice  $L$  is called complete lattice if for every non empty subset of  $L$  has its *Sup* and *Inf* in  $L$  . In this chapter we also proved in any lattice the distributive inequalities

$$(i) a \wedge (b \vee c) \geq (a \wedge b) \vee (a \wedge c)$$

$$(ii) a \vee (b \wedge c) \leq (a \vee b) \wedge (a \vee c).$$

**1.2 Relations , Lattices , Complete Lattices .**

**Definition (Relation) :** A relation  $R$  from  $A$  to  $B$  is a subset of  $A \times B$  .

**Example 1.2.1 :** Let  $A = \{ x, y \}$

$$B = \{ 2, 4, 6 \}$$

Then  $R = \{ (x, 2), (x, 6), (y, 4) \}$  is a relation from  $A$  to  $B$  .

**Definition (Reflexive Relation) :** Let  $R = (A, A P(x, y))$  be a relation in a set  $A$ , i.e., let  $R$  be a subset of  $A \times A$  . Then  $R$  is called a reflexive relation if, for every  $a \in A$ ,

$$(a, a) \in R .$$

In other words,  $R$  is reflexive if for every element in  $A$  is related to itself .

**Example 1.2.2 :** Let  $Y = \{1,2,3,4,5\}$  and

$$R = \{(1,1), (2,2), (2,3), (3,3), (4,4), (3,4), (5,5)\}.$$

Then  $R$  is a reflexive relation .

**Definition (Symmetric Relation) :** Let  $R$  be a subset of  $A \times A$  i.e. let  $R$  be a relation of in  $A$  . Then  $R$  is called a symmetric relation if

$$(a, b) \in R \text{ implies } (b, a) \in R$$

**Example 1.2.3 :** Let  $S = \{1,2,3\}$  and let

$$R = \{(1,2),(1,3),(2,3),(2,1),(3,1),(3,2)\}$$

Then  $R$  is a symmetric relation .

**Definition (Anti-Symmetric Relation) :** A relation  $R$  in a set  $A$  i.e. a subset of  $A \times A$  is called an anti-symmetric relation if

$$(a, b) \in R \text{ and } (b, a) \in R \text{ implies } a = b$$

In other words , if  $a \neq b$  then possibly  $a$  is related to  $b$  or possibly  $b$  is related to  $a$  but never both .

**Example 1.2.4 :** Let  $A$  be a family of sets, and let  $R$  be the relation in  $A$  defined by “  $x$  is a sub set of  $y$ ”. Then  $R$  is anti-symmetric since  $C \subseteq D$  and  $D \subseteq C$  implies  $C = D$ .

**Definition (Transitive Relation):** A relation  $R$  in a set  $A$  is called a transitive relation if  $(a, b) \in R$  and  $(b, c) \in R$  implies  $(a, c) \in R$

In other words, if  $a$  is related to  $b$  and  $b$  is related to  $c$ , then  $a$  is related to  $c$  .

**Example 1.2.5 :** Let  $B = \{ a, b, c \}$  and let

$$R = \{ (a, b),(c, b),(b, a),(a, c) \}$$

Then  $R$  is not a transitive relation since

$$(c, b) \in R \text{ and } (b, a) \in R \text{ but } (c, a) \notin R .$$

**Definition (Equivalence Relation) :** A relation  $R$  in a set  $A$  is an equivalence relation if

- ( 1 )  $R$  is reflexive, that is, for every  $a \in A$  ,  $(a, a) \in R$  .
- ( 2 )  $R$  is symmetric, that is,  $(a, b) \in R$  implies  $(b, a) \in R$  .
- ( 3 )  $R$  is transitive, that is,  $(a, b) \in R$  and  $(b, c) \in R$

implies  $(a, c) \in R$ .

**Example 1.2.6 :** Let  $X = \{ a, b, c \}$  be a set and let

$$R = \{ (a, a), (a, b), (a, c), (b, a), (b, b), (b, c), (c, a), (c, b), (c, c) \}$$

be a relation of  $A \times A$  then the relation  $R$  is an equivalence relation, since

( 1 )  $R$  is reflexive,  $(a, a), (b, b), (c, c) \in R$

( 2 )  $R$  is symmetric,  $(a, b), (b, a), (a, c), (c, a) \in R$  and

( 3 )  $R$  is transitive,  $(a, c), (c, b), (a, b) \in R$ .

**Definition (Partially ordered set) :** A non empty set  $P$ , together with a binary relation  $R$  is said to form a partially ordered set or a poset if the following conditions hold :

P1: Reflexivity :  $(a, a) \in R$  for all  $a \in P$ .

P2: Anti-Symmetry : If  $(a, b) \in R, (b, a) \in R$  then  $a = b$   
 $(a, b \in P)$ .

P3: Transitivity : If  $(a, b) \in R, (b, c) \in R$  then  $(a, c) \in R$   
 $(a, b, c \in P)$ .

**Example 1.2.7 :** The set  $N$  of natural numbers under divisibility forms a poset . Thus here  $a \leq b$  means  $a \mid b$  ( $a$  divides  $b$ ).

**Definition (Greatest element) :** Let  $P$  be a poset . If  $\exists$  an element  $a \in P$  such that  $x \leq a$  for all  $x \in P$  then  $a$  is called greatest or unity element of  $P$  . Greatest element if it exists , will be unique .

**Definition (Least element) :** An element  $b \in P$  will be called least or zero element of  $P$  if  $b \leq x \forall x \in P$  . It is denoted by  $0$  . Least element if it exists , will be unique .

**Example 1.2.8 :** Let  $A = \{1, 2, 3\}$ . Then  $(P(A), \subseteq)$  is a poset .

$$\text{Let } B = \{ \phi, \{1, 2\}, \{2\}, \{3\} \}$$

Then  $(B, \subseteq)$  is a poset with  $\phi$  as least element.  $B$  has no greatest element.

Let  $C = \{\{1,2\}, \{2\}, \{3\}, \{1,2,3\}\}$ .

Then  $C$  has greatest element  $\{1,2,3\}$ , but no least element.

If  $D = \{\phi, \{1\}, \{2\}, \{1,2\}\}$ .

Then  $D$  has both least and greatest elements namely  $\phi$  and  $\{1,2\}$ .

Again  $E = \{\{1\}, \{2\}, \{1,3\}\}$  has neither least nor greatest element.

**Definition (Bounded poset) :** If a poset  $P$  has least and greatest elements we call it a Bounded poset. Indeed  $0 \leq x \leq u \quad \forall x \in P$ .

**Definition (Upper bound) :** Let  $S$  be non empty subset of a poset  $P$ .

An element  $a \in P$  is called an upper bound of  $S$  if  $x \leq a \quad \forall x \in S$ .

**Definition (Least upper bound) :** If  $a$  is an upper bound of  $S$  s.t.,  $a \leq b$  for all upper bounds  $b$  of  $S$  then  $a$  is called least upper bound (l.u.b) or supremum of  $S$ . We write  $Sup S$  for supremum  $S$ .

It is clear that there can be more than one upper bound of a set. But  $Sup$ , if it exists, will be unique.

**Definition (Lower bound) :** An element  $a \in P$  will be call a lower bound of  $S$  if  $a \leq x \quad \forall x \in S$ .

**Definition (Greatest lower bound) :** If  $a$  is a lower bound of  $S$  then  $a$  will called greatest lower bound (g.l.b) or Infimum  $S$  ( $Inf S$ ) if  $b \leq a$  for all lower bounds  $b$  of  $S$ .

**Example 1.2.9 :** Let  $(Z, \leq)$  be the poset of integers

Let  $S = \{ \dots - 3, -2, -1, 0, 1, 2, 3 \}$  then  $\text{Sup } S = 3$ .

Again in the poset  $(\mathbb{R}, \leq)$  of real numbers if

$S = \{x \in \mathbb{R} \mid x < 0, x \neq 0\}$  then  $\text{Sup } S = 0$  (and it does not belong to  $S$ ).

**Definition (Chain) :** If  $P$  is a poset in which every two members are comparable it is called a totally ordered set or a toset or a chain .

Thus if  $P$  is a chain and  $x, y \in P$  then either  $x \leq y$  or  $y \leq x$ .

Fig. 1.1

**Definition (Lattice) :** A poset  $(L, \leq)$  is said to form a lattice if for every  $a, b \in L$   $\text{Sup } \{a, b\}$  and  $\text{Inf } \{a, b\}$  exist in  $L$ .

In that case, we write

$$\text{Sup } \{a, b\} = a \vee b \quad (\text{read } a \text{ join } b)$$

$$\text{Inf } \{a, b\} = a \wedge b \quad (\text{read } a \text{ meet } b)$$

Other notation like  $a + b$  and  $a \cdot b$  or  $a \cup b$  and  $a \cap b$  are also used for  $\text{Sup } \{a, b\}$  and  $\text{Inf } \{a, b\}$ .

**Example 1.2.10:** Let  $A$  be a non empty set, then the poset  $(P(A), \subseteq)$  of all subset of  $A$  is a lattice .Here for  $X, Y \in P(A)$ .

$$X \wedge Y = X \cap Y \text{ and}$$

$$X \vee Y = X \cup Y$$

As a particular case, when  $A = \{a, b\}$

$$P(A) = \{\phi, \{a\}, \{b\}, \{a, b\}\}$$

Fig. 1.2

**Example 1.2.11 :** The set  $N$  of all natural numbers under divisibility forms a lattice .Here

$$a \wedge b = \text{g . c . d } (a, b)$$

$$a \vee b = \text{l . c . m } (a, b) \quad \text{for all } a, b \in N .$$

**Example 1.2.12 :** The set  $L = \{1,2,4,5,10,20,25,50,100\}$  of factors of 100 forms a lattice under divisibility .It is represented by the following diagram.

Fig. 1.3

**Example 1.2.13 :** Every chain is a lattice .Since any two elements  $x, y$  of chain are comparable , say  $x \leq y$  we find

$$x \wedge y = \text{Inf} \{x, y\} = x, \quad x \vee y = \text{Sup} \{x, y\} = y.$$

**Definition (Meet-Semi Lattice) :** A poset  $(P, \leq)$  is called a meet-semi lattice if for all  $a, b \in P$   $\text{Inf} \{a, b\}$  exists.

or

A non-empty set  $P$  together with a binary operation  $\wedge$  is called a meet-semi lattice if  $\forall a, b, c \in P$

$$(i) a \wedge a = a$$

$$(ii) a \wedge b = b \wedge a$$

$$(iii) a \wedge (b \wedge c) = (a \wedge b) \wedge c.$$

**Definition (Join-Semi Lattice) :** A poset  $(P, \leq)$  is called a join-semi lattice if for all  $a, b \in P$   $\text{Sup}\{a, b\}$  exists.

or

A non-empty set  $P$  together with a binary operation  $\vee$  is called a join-semi lattice if  $\forall a, b, c \in P$

$$(i) a \vee a = a$$

$$(ii) a \vee b = b \vee a$$

$$(iii) a \vee (b \vee c) = (a \vee b) \vee c.$$

**Definition (Sublattice) :** A non-empty subset  $S$  of a lattice  $L$  is called a sublattice of  $L$  if  $a, b \in S \Rightarrow a \wedge b, a \vee b \in S$ .

**Example 1.2.14 :** Let  $L = \{1,2,3,4,6,12\}$  of factors of 12 under divisibility forms a lattice. Then  $A = \{1,2\}$  and  $B = \{1,3\}$  are sublattice of  $L$ .

Fig. 1.4

**Definition (Convex sublattice) :** The subset  $D$  of the lattice  $L$  is called convex, if  $a, b \in D, c \in L$  and  $a \leq c \leq b$  imply that  $c \in D$ .

**Example 1.2.15 :** For  $a, b \in L, a \leq b$  the interval  $[a, b] =$

$\{x \mid a \leq x \leq b\}$  is an important example of a convex sublattice.

**Example 1.2.16 :** For a chain  $C, a, b \in C, a \leq b$  we can also define the

half-open intervals :  $(a, b] = \{x \mid a < x \leq b\}$  and

$[a, b) = \{x \mid a \leq x < b\}$  and the open interval :

$(a, b) = \{x \mid a < x < b\}$ . These are also examples of convex sublattices.

**Example 1.2.17 :** In the lattice  $\{1, 2, 3, 4, 6, 12\}$  under divisibility  $\{1, 6\}$  is a sublattice which is not convex as  $2, 3 \in [1, 6]$  but  $2, 3 \notin \{1, 6\}$ .

Thus  $[1, 6] \not\subseteq \{1, 6\}$ .

Fig. 1.5

**Definition (Complete Lattice) :** A lattice  $L$  is called a complete lattice if every non-empty subset of  $L$  has its *Sup* and *Inf* in  $L$ .

or

A lattice  $L$  is called a complete lattice if for any subset  $H$  of  $L$ , *Sup*  $H$  and *Inf*  $H$  exists in  $L$ .

**Example 1.2.18 :** Every finite lattice is complete.

**Example 1.2.19 :** The real interval  $[0,1]$  with usual  $\leq$  form a complete lattice.

### 1.3 Ideals , Binary Operations , Dual Ideals .

**Definition (Ideal) :** A non-empty subset  $I$  of a lattice  $L$  is called an ideal of  $L$  if

$$(i) \quad i, j \in I \Rightarrow i \vee j \in I$$

$$(ii) \quad i \in I, a \in L \Rightarrow a \wedge i \in I$$

**Example 1.3.1 :** Let  $L = \{1, 2, 4, 8\}$  be lattice of factors of 8 under divisibility. Then  $\{1\}, \{1, 2\}, \{1, 4\}, \{1, 2, 4, 8\}$  are all the ideals of  $L$ .

Fig. 1.6

**Definition (Dual Ideal) :** A non-empty subset  $I$  of a lattice  $L$  is called a dual ideal (or filter) of  $L$  if

$$(i) \quad i, j \in I \Rightarrow i \wedge j \in I$$

$$(ii) \quad i \in I, a \in L \Rightarrow a \vee i \in I$$

**Example 1.3.2 :** Let  $L = \{1, 2, 4, 8\}$  be the lattice under divisibility.

Then  $A = \{1, 2\}$  and  $\{1, 4\}$  are ideals but not dual ideals.

$B = \{2, 8\}$  and  $\{4, 8\}$  are dual ideals but not ideals.

$C = \{2, 4\}$  is neither an ideal nor a dual ideal.

**Definition (Principal Ideal) :** Let  $L$  be a lattice and  $a \in L$  be any element. Let  $(a] = \{x \mid x \leq a\}$ , then  $(a]$  forms an ideal of  $L$ . It is called principal ideal generated by  $a$ .

**Definition (Principal dualideal) :** Let  $L$  be a lattice and  $a \in L$  be any element. The set  $[a) = \{x \in L \mid a \leq x\}$  forms a dual ideal of  $L$ , called the principal dualideal generated by  $a$ .

**Definition (Prime ideal) :** An ideal  $P$  of a lattice  $L$  is called a prime ideal of  $L$  if  $P$  is properly contained in  $L$  and whenever  $a \wedge b \in P$  then either  $a \in P$  or  $b \in P$ .

or

An ideal  $P$  of a lattice  $L$  is called a prime ideal if for all  $a, b \in L$ ,  $a \wedge b \in P$  implies either  $a \in P$  or  $b \in P$ .

**Definition (Binary operation) :** If  $A$  is a non-empty set then a map  $f: A \times A \longrightarrow A$  is called a binary composition (or binary operation) on  $A$ .

Thus binary composition is a rule by which we combine any two member of the same set.

Multiplication is another familiar example of a binary operation on naturals or reals.

We use different symbols like  $*$ ,  $\circ$ ,  $\oplus$  etc. for binary compositions.

If  $*$  is a binary operation on a set  $A$  and  $a, b \in A$  then by definition  $a * b \in A$ . We sometimes express this by saying that  $A$  is closed under  $*$ .

**Example 1.3.3 :** Let  $A = \{0,1,2,3,4\}$ . Define  $\oplus$  on  $A$  by for  $a, b \in A$ ,  $a \oplus b$  means the remainder got by dividing  $a+b$  by 5. Then  $\oplus$  will be a binary composition on  $A$ . The following table gives us all the values and since all the values of  $a \oplus b$  for any  $a, b$  lie in  $A$ , we find  $A$  is closed under this composition.

$\oplus$	0	1	2	3	4
0	0	1	2	3	4
1	1	2	3	4	0
2	2	3	4	0	1
3	3	4	0	1	2
4	4	0	1	2	3

In fact, the above is called addition modulo 5. One could generalize this on a set  $A = \{0,1,2,\dots,n-1\}$  addition modulo  $n$ .

**Definition (Algebraic Lattice) :** A non-empty set  $L$  together with two binary compositions (operations)  $\wedge$  and  $\vee$  is said to form a lattice if  $\forall a, b, c \in L$  the following conditions hold :

$$L1 : \text{Idempotency : } a \wedge a = a, \quad a \vee a = a$$

$$L2 : \text{Commutativity : } a \wedge b = b \wedge a, \quad a \vee b = b \vee a$$

$$L3 : \text{Associativity : } a \wedge (b \wedge c) = (a \wedge b) \wedge c,$$

$$a \vee (b \vee c) = (a \vee b) \vee c$$

$$L4 : \text{Absorption : } a \wedge (a \vee b) = a, \quad a \vee (a \wedge b) = a.$$

**Definition (Duality) :** Let  $O$  be a relation defined on a set  $A$ . Then converse of  $O$  (denoted by  $\bar{O}$ ) is defined  $a \bar{O} b \Leftrightarrow b O a$ ,  $a, b \in A$ .

**Definition (Dual) :** If  $(A, O)$  be a poset then the poset  $(\bar{A}, \bar{O})$ , where

$\bar{A} = A$  and  $\bar{O}$  is converse of  $O$  is called **dual** of  $A$ .

**Problem 1.3.1 :** If we consider the two chains with diagram

$C_1 = \{0,1,2\}$  and  $C_2 = \{0,1\}$  then  $C_1 \times C_2$  is a lattice .

Fig. 1.7

**Proof :**  $C_1 = \{0,1,2\}$

$C_2 = \{0,1\}$

$\therefore C_1 \times C_2 = \{(0,0), (0,1), (1,0), (1,1), (2,0), (2,1)\}$ .

*Inf* and *Sup* of any two elements of  $C_1 \times C_2$  lie in  $C_1 \times C_2$ .

So  $C_1 \times C_2$  satisfy the conditions of lattice . Hence  $C_1 \times C_2$  is a lattice .

**Example 1.3.4 :**

$$(0,1) \wedge (2,0) = (0,0) \in C_1 \times C_2$$

$$(0,1) \vee (2,0) = (2,1) \in C_1 \times C_2$$

**Theorem 1.3.2 :** If  $L$  is any lattice , then for any  $a, b, c \in L$  , the following results hold .

- (1)  $a \wedge a = a, \quad a \vee a = a$  ( Idempotency )  
 (2)  $a \wedge b = b \wedge a, \quad a \vee b = b \vee a$  ( Commutativity )  
 (3)  $a \wedge ( b \wedge c ) = ( a \wedge b ) \wedge c$  ( Associativity )  
 $a \vee ( b \vee c ) = ( a \vee b ) \vee c$   
 (4)  $a \wedge b \leq a, \quad b \leq a \vee b$   
 (5) If  $0, u \in L$ , then  
 $0 \wedge a = 0, \quad 0 \vee a = a$   
 $u \wedge a = a, \quad u \vee a = u.$   
 (6)  $a \wedge ( a \vee b ) = a$  ( Absorption )  
 $a \vee ( a \wedge b ) = a$

**Proof :**

- (1)  $a \wedge a = \text{Inf} \{ a, a \} = \text{Inf} \{ a \} = a .$   
 $a \vee a = \text{Sup} \{ a, a \} = \text{Sup} \{ a \} = a .$   
 (2)  $a \wedge b = \text{Inf} \{ a, b \} = \text{Inf} \{ b, a \} = b \wedge a .$   
 $a \vee b = \text{Sup} \{ a, b \} = \text{Sup} \{ b, a \} = b \vee a .$   
 (3) Let  $b \wedge c = d$ , then  $d = \text{Inf} \{ b, c \}$   
 $\Rightarrow d \leq b, \quad d \leq c$   
 Let  $e = \text{Inf} \{ a, d \}$  then  $e \leq a, \quad e \leq d$   
 Thus  $e \leq a, \quad e \leq b, \quad e \leq c .$  (using transitivity)  
 Hence  $e = a \wedge d = a \wedge ( b \wedge c ) = \text{Inf} \{ a, b, c \}$   
 Therefore  $a \wedge ( b \wedge c ) = \text{Inf} \{ a, b, c \}$   
 Similarly, we can show that  $( a \wedge b ) \wedge c = \text{Inf} \{ a, b, c \}$   
 Hence  $a \wedge ( b \wedge c ) = ( a \wedge b ) \wedge c .$   
 Again let  $b \vee c = d$ , then  $d = \text{Sup} \{ b, c \}$

$$\Rightarrow d \geq b, \quad d \geq c$$

Let  $e = \text{Sup}\{a, d\}$  then  $e \geq a, \quad e \geq d$

Thus  $e \geq a, \quad e \geq b, \quad e \geq c$  (using transitivity)

Hence  $e = a \vee d = a \vee (b \vee c) = \text{Sup}\{a, b, c\}$

Similarly, we can show that  $(a \vee b) \vee c = \text{Sup}\{a, b, c\}$

Hence  $a \vee (b \vee c) = (a \vee b) \vee c$

(4) Follows by definitions of meet and join .

(5) Since  $0 \leq x \leq u$ , for all  $x \in L$ , the results are trivial for meet and join .

(6)  $a \leq a \vee b$  By (4)

$$\begin{aligned} \therefore a \wedge (a \vee b) &= a && \text{[Since } a \leq b \Leftrightarrow a \wedge b = a \\ &&& \Leftrightarrow a \vee b = b \end{aligned}$$

Again  $a \wedge b \leq a$  By (4)

$$\therefore (a \wedge b) \vee a = a$$

Hence  $a \vee (a \wedge b) = a$  .

**Problem 1.3.3 :** Show that idempotent laws follow from the absorption laws .

**Proof :** We have  $a \wedge (a \vee b) = a$  and  $a \vee (a \wedge b) = a$

Take  $b = a \wedge b$  in first and we get  $a \wedge (a \vee (a \wedge b)) = a$

or  $a \wedge a = a$  .

Similarly we can show  $a \vee a = a$  . •

**Theorem 1.3.4 :** In any lattice the distributive inequalities

$$(i) \quad a \wedge (b \vee c) \geq (a \wedge b) \vee (a \wedge c)$$

$$(ii) \quad a \vee (b \wedge c) \leq (a \vee b) \wedge (a \vee c)$$

hold for any  $a, b, c$ .

**Proof:** (i)  $a \wedge b \leq a$

$$a \wedge b \leq b \leq b \vee c$$

$\Rightarrow a \wedge b$  is lower bound of  $\{a, b \vee c\}$

$$\Rightarrow a \wedge b \leq a \wedge (b \vee c) \quad (1)$$

Again  $a \wedge c \leq a$

$$a \wedge c \leq c \leq b \vee c$$

$$\Rightarrow a \wedge c \leq a \wedge (b \vee c) \quad (2)$$

(1) and (2) show that  $a \wedge (b \vee c)$  is an upper bound of

$$\{a \wedge b, a \wedge c\}$$

$$\Rightarrow (a \wedge b) \vee (a \wedge c) \leq a \wedge (b \vee c)$$

$$\text{Hence } a \wedge (b \vee c) \geq (a \wedge b) \vee (a \wedge c) \quad \bullet$$

(ii)  $a \vee b \geq a$

$$a \vee b \geq b \geq b \wedge c$$

$\Rightarrow a \vee b$  is an upper bound of  $\{a, b \wedge c\}$

$$\Rightarrow a \vee b \geq a \vee (b \wedge c) \quad (1)$$

Again  $a \vee c \geq a$

$$a \vee c \geq c \geq b \wedge c$$

$$\Rightarrow a \vee c \geq a \vee (b \wedge c) \quad (2)$$

(1) and (2) show that  $a \vee (b \wedge c)$  is a lower bound of

$$\{a \vee b, a \vee c\}$$

$$\Rightarrow a \vee (b \wedge c) \leq (a \vee b) \wedge (a \vee c) \quad \blacksquare$$

**Theorem 1.3.5:** In any lattice  $L$ ,

$$(a \wedge b) \vee (b \wedge c) \vee (c \wedge a) \leq (a \vee b) \wedge (b \vee c) \wedge (c \vee a),$$

for all  $a, b, c \in L$ .

**Proof:** Since  $a \wedge b \leq a \vee b$

$$a \wedge b \leq b \leq b \vee c$$

$$a \wedge b \leq a \leq c \vee a$$

We find

$$(a \wedge b) \leq (a \vee b) \wedge (b \vee c) \wedge (c \vee a)$$

Similarly,  $(b \wedge c) \leq (a \vee b) \wedge (b \vee c) \wedge (c \vee a)$

and  $(c \wedge a) \leq (a \vee b) \wedge (b \vee c) \wedge (c \vee a)$

Hence  $(a \wedge b) \vee (b \wedge c) \vee (c \wedge a) \leq (a \vee b) \wedge (b \vee c) \wedge (c \vee a)$  ■

**Theorem 1.3.6:** The dual of a lattice is also a lattice .

**Proof:** Let  $(L, R)$  be a lattice and let  $(\bar{L}, \bar{R})$  be its dual . Then  $\bar{L} = L$  and  $\bar{R}$  is converse of  $R$  . Let  $x, y \in \bar{L}$  be any elements, then  $x, y \in L$  and  $L$  is a lattice ,  $Sup\{x, y\}$  exists in  $L$  . Let it be  $x \vee y$  .

Then  $x R (x \vee y)$

$$y R (x \vee y)$$

$$\Rightarrow (x \vee y) \bar{R} x$$

$$(x \vee y) \bar{R} y$$

$$\Rightarrow x \vee y \text{ is a lower bound of } \{x, y\} \text{ in } \bar{L} .$$

If  $z$  is any lower bound of  $\{x, y\}$  in  $\bar{L}$  then

$$z \bar{R} x, z \bar{R} y$$

$$\Rightarrow x R z, y R z$$

$$\Rightarrow z \text{ is an upper bound of } \{x, y\} \text{ in } L$$

$$\Rightarrow (x \vee y) R z \text{ as } x \vee y = Sup\{x, y\} \text{ in } L$$

$$\Rightarrow z \bar{R} (x \vee y)$$

or that  $x \vee y$  is greatest lower bound of  $\{x, y\}$  in  $\bar{L}$  . Similarly

we can show  $x \wedge y$  will be  $Sup\{x, y\}$  in  $\bar{L}$ .

Hence  $\bar{L}$  is a lattice. ■

**Definition (Complete Lattice) :** A lattice  $A$  is called a complete lattice if every non-empty subset of  $A$  has its  $Sup$  and  $Inf$  in  $A$ .

**Example 1.3.5 :** Every finite lattice is complete.

**Example 1.3.6 :** The real interval  $[0, 1]$  with usual  $\leq$  forms a complete lattice.

**Example 1.3.7 :** The lattice  $(Z, \leq)$  of integers is not complete as the subset

$K = \{x \in Z \mid x > 0\}$  does not have an upper bound and therefore a  $Sup$  in  $Z$ .

**Theorem 1.3.7 :** The dual of a complete lattice is a complete lattice.

**Proof :** Let  $(A, O)$  be a complete lattice and let  $(\bar{A}, \bar{O})$  be its dual.

Then  $(\bar{A}, \bar{O})$  is a lattice.

Let  $\emptyset \neq S \subseteq \bar{A}$  be any subset of  $\bar{A}$ . Since  $A$  is complete,  $Sup S$  and  $Inf S$  exists in  $A$ .

Let  $a = Inf S$  in  $A$

Then  $a O x \quad \forall x \in A$

$\Rightarrow x \bar{O} a \quad \forall x \in \bar{A}$

$\Rightarrow a$  is an upper bound of  $S$  in  $\bar{A}$ .

Let  $b$  be any other upper bound of  $S$  in  $\bar{A}$ .

Then  $x \bar{O} b \quad \forall x \in \bar{A}$

$\Rightarrow b O x \quad \forall x \in A$

$\Rightarrow b O a$  as  $a = Inf S$  in  $A$

$\Rightarrow a \bar{O} b$  or that  $a$  is l.u.b. of  $S$  in  $\bar{A}$ .

Similarly, we can show that  $Sup S$  in  $A$  will be  $Inf S$  in  $\bar{A}$ .

Hence  $(\bar{A}, \bar{O})$  is complete. ■

**Theorem 1.3.8 :** If  $A$  and  $B$  are two lattices. Then the product  $A \times B$  is a lattice.

**Proof :** Given  $A$  and  $B$  be two lattices then we have

$$A \times B = \{(a, b) \mid a \in A, b \in B\}$$

is a poset under the relation  $\leq$  defined by

$$(a_1, b_1) \leq (a_2, b_2) \Leftrightarrow a_1 \leq a_2 \text{ in } A \\ b_1 \leq b_2 \text{ in } B.$$

We show  $A \times B$  forms a lattice.

Let  $(a_1, b_1), (a_2, b_2) \in A \times B$  be any elements.

Then  $a_1, a_2 \in A$  and  $b_1, b_2 \in B$ .

Since  $A$  and  $B$  are lattices,  $\{a_1, a_2\}$  and  $\{b_1, b_2\}$  have  $Sup$  and  $Inf$  in  $A$  and  $B$  respectively.

$$\text{Let } a_1 \wedge a_2 = Inf \{a_1, a_2\}, \quad b_1 \wedge b_2 = Inf \{b_1, b_2\}$$

$$\text{then } a_1 \wedge a_2 \leq a_1, \quad a_1 \wedge a_2 \leq a_2$$

$$b_1 \wedge b_2 \leq b_1, \quad b_1 \wedge b_2 \leq b_2$$

$$\Rightarrow (a_1 \wedge a_2, b_1 \wedge b_2) \leq (a_1, b_1)$$

$$(a_1 \wedge a_2, b_1 \wedge b_2) \leq (a_2, b_2)$$

$$\Rightarrow (a_1 \wedge a_2, b_1 \wedge b_2) \text{ is a lower bound of } \\ \{(a_1, b_1), (a_2, b_2)\}$$

Suppose  $(c, d)$  is any lower bound of  $\{(a_1, b_1), (a_2, b_2)\}$

$$\text{Then } (c, d) \leq (a_1, b_1)$$

$$(c, d) \leq (a_2, b_2)$$

$$\Rightarrow c \leq a_1, c \leq a_2, d \leq b_1, d \leq b_2$$

$$\Rightarrow c \text{ is a lower bound of } \{a_1, a_2\} \text{ in } A.$$

$d$  is a lower bound of  $\{b_1, b_2\}$  in  $B$ .

$$\Rightarrow c \leq a_1 \wedge a_2 = \text{Inf} \{a_1, a_2\}$$

$$d \leq b_1 \wedge b_2 = \text{Inf} \{b_1, b_2\}$$

$$\Rightarrow (c, d) \leq (a_1 \wedge a_2, b_1 \wedge b_2)$$

or that  $(a_1 \wedge a_2, b_1 \wedge b_2)$  is g.l.b.  $\{(a_1, b_1), (a_2, b_2)\}$ .

Similarly (by duality) we can say that

$(a_1 \vee a_2, b_1 \vee b_2)$  is l.u.b.  $\{(a_1, b_1), (a_2, b_2)\}$ .

Hence  $A \times B$  is a lattice.

$$\text{Also } (a_1, b_1) \wedge (a_2, b_2) = (a_1 \wedge a_2, b_1 \wedge b_2)$$

$$(a_1, b_1) \vee (a_2, b_2) = (a_1 \vee a_2, b_1 \vee b_2). \quad \blacksquare$$

**Theorem 1.3.9 :** If  $(P, \leq)$  is a poset with least element  $0$  such that every non empty subset  $S$  of  $P$  has  $\text{Sup}$  then  $P$  is a complete lattice.

**Proof :** Let  $S$  be any non empty subset of  $P$ . We need prove that  $\text{Inf } S$  exists.

Since  $0$  is the least element of  $P$ ,  $0 \leq x \quad \forall x \in P$

and thus  $0 \leq s \quad \forall s \in S$

$\Rightarrow 0$  is a lower bound of  $S$ .

subset of  $P$  and, therefore, by given condition  $\text{Sup } T$  exists .

Let  $T =$  set of all lower bounds of  $S$ , then  $T$  is a non empty subset of  $P$  and therefore, by given condition  $\text{Sup } T$  exists .

Let  $k = \text{Sup } T$

Now  $s \in S \Rightarrow x \leq s, \quad \forall x \in T$

$\Rightarrow$  each element of  $S$  is an upper bound of  $T$

$\Rightarrow k \leq s \quad \forall s \in S$

$\Rightarrow k$  is a lower bound of  $S$ . But  $k$  being an upper bound of  $T$

means  $x \leq k \quad \forall x \in T$  i.e.,  $x \leq k \quad \forall$  lower bounds of  $S$   
 $\Rightarrow k = \text{Inf } S$

Hence  $P$  is a poset in which every non empty subset has *Sup* and *Inf* and thus  $P$  is a complete lattice. ■

**Theorem 1.3.10 :** A lattice  $L$  is a chain if and only if every non empty subset of  $L$  is a sublattice .

**Proof :** If the lattice is a chain then we have already shown that every non empty subset of  $L$  is a sublattice.

Conversely, let  $L$  be a lattice s.t., every non empty subset of  $L$  is a sublattice. We show  $L$  is a chain.

Let  $a, b \in L$  be any elements.

Then  $\{a, b\}$  being a non empty subset of  $L$  will be a sub lattice of  $L$ . Thus by definition of sublattice  $a \wedge b \in \{a, b\}$

$$\Rightarrow a \wedge b = a \quad \text{or} \quad a \wedge b = b$$

$$\Rightarrow a \leq b \quad \text{or} \quad b \leq a$$

i.e.,  $a, b$  are comparable.

Hence  $L$  is a chain. ■

**Theorem 1.3.11 :** Intersection of two ideals is an ideal.

**Proof :** Let  $X, Y$  be two ideals of a lattice  $L$ .

Since  $X, Y$  are non empty,  $\exists$  some  $x \in X, y \in Y$ .

Now  $x \in X, y \in Y \subseteq L \Rightarrow x \wedge y \in X$ .

Similarly  $x \wedge y \in Y$

Thus  $X \cap Y \neq \emptyset$ .

Let  $u, v \in X \cap Y$  be any elements .

$$\Rightarrow u, v \in X \quad \text{and} \quad u, v \in Y$$

$$\Rightarrow u \vee v \in X \quad \text{and} \quad u \vee v \in Y \quad \text{as } X, Y \text{ are ideals .}$$

$$\Rightarrow u \vee v \in X \cap Y.$$

Again, if  $a \in X \cap Y$  and  $l \in L$  be any elements then  $a \in X$ ,  
 $a \in Y, l \in L$

$$\Rightarrow a \wedge l \in X \quad \text{and} \quad a \wedge l \in Y$$

$$\Rightarrow a \wedge l \in X \cap Y$$

Hence  $X \cap Y$  is an ideal. ■

☐ The result can clearly be extended to intersection of more than two ideals.

**Problem 1.3.12 :** Show that union of two ideals may not be an ideal.

**Solution :**

Fig. 1.8

Take  $A = \{1, 2\}$ ,  $B = \{1, 3\}$ . Then  $A, B$  are ideals of the lattice  $L = \{1, 2, 3, 4, 6, 12\}$  under divisibility, but  $A \cup B$  is not an ideal.  $2, 3 \in A \cup B$  but  $2 \vee 3 = 6 \notin A \cup B$ . ■

**Theorem 1.3.13 :** Union of two ideals is an ideal if and only if one of them is contained in the other .

**Proof :** One side of the theorem follows trivially . Let now  $A$  and  $B$  be two ideals of a lattice  $L$  s.t.,  $A \cup B$  is also an ideal of  $L$  .

Suppose  $A \not\subseteq B$  and  $B \not\subseteq A$

$\Rightarrow \exists x \in A$  s.t.,  $x \notin B$

$\exists y \in B$  s.t.,  $y \notin A$

$\Rightarrow x, y \in A \cup B$

$\Rightarrow x \vee y \in A \cup B$  as  $A \cup B$  is an ideal .

$\Rightarrow x \vee y \in A$  or  $x \vee y \in B$ .

If  $x \vee y \in A$ , then as  $y \in B \subseteq L$

$y \wedge (x \vee y) \in A$  or that  $y \in A$ , a contradiction .

Similarly  $x \vee y \in B$  would lead us to the result that  $x \in B$  which is not true .

Hence either  $A \subseteq B$  or  $B \subseteq A$  . ■

**Theorem 1.3.14 :** A non empty subset  $I$  of a lattice  $L$  is an ideal if and only if

(i)  $i, j \in I \Rightarrow i \vee j \in I$

(ii)  $i \in I, x \leq i \Rightarrow x \in I$ .

**Proof :** Let  $I$  be an ideal of a lattice  $L$ .

By definition of ideal (i) is satisfied .

Let  $i \in I, x \leq i$ , then  $x = i \wedge x \in I$  (by def. of ideal).

Conversely, we need to show that  $i \in I, a \in L \Rightarrow a \wedge i \in I$

Since  $a \wedge i \leq i$  and  $i \in I$

By given condition  $a \wedge i \in I$

Hence  $I$  is an ideal. ■

**Theorem 1.3.15 :** The set of all ideals of a lattice  $L$  forms an ideal under relation  $\subseteq$ .

**Proof :** Let  $I(L) =$  set of all ideals of a lattice  $L$ , then  $I(L) \neq \emptyset$  as  $L \in I(L)$ .

Clearly also  $(I(L), \subseteq)$  is a poset. To show that  $I(L)$  is a lattice we need find *Sup* and *Inf* of  $\{A, B\}$  for any  $A, B \in I(L)$ . Since intersection of two ideals is an ideal and  $A \cap B$  is the largest set contained in  $A$  and  $B$  it is obvious that

$$A \wedge B = \text{Inf } \{A, B\} = A \cap B$$

Again,  $A \cup B$  is the smallest set containing  $A$  and  $B$ . But then  $A \cup B$  may not be an ideal, so it cannot work as our  $A \vee B$ . We consider the set

$$X = \{x \in L \mid x \leq a \vee b \text{ for some } a \in A, b \in B\}$$

$$\text{We claim } X = A \vee B$$

For any  $a \in A$ ,  $a \leq a \vee b$  for any  $b \in B$

$$\Rightarrow a \in X \Rightarrow A \subseteq X$$

$$\text{Similarly, } B \subseteq X$$

Thus  $X \neq \emptyset$  and  $A \cup B \subseteq X$ .

We show  $X$  is an ideal of  $L$ .

Let  $x, y \in X$  be any elements.

Then  $x \leq a_1 \vee b_1$

$$y \leq a_2 \vee b_2 \quad \text{for some } a_1, a_2 \in A, b_1, b_2 \in B$$

$$\Rightarrow x \vee y \leq (a_1 \vee b_1) \vee (a_2 \vee b_2)$$

$$\Rightarrow x \vee y \in X \quad \text{as } a_1 \vee a_2 \in A, b_1 \vee b_2 \in B.$$

Again, for any  $x \in X$  and  $l \in L$ , Since  $x \leq a \vee b$ ,  $a \in A$ ,  $b \in B$  we have  $x \wedge l \leq x \leq a \vee b$ .

$\Rightarrow x \wedge l \in X$  which then is an ideal of  $L$ .

If  $C$  be any ideal of  $L$  containing  $A$  and  $B$  then  $X \subseteq C$  as  $x \in X$

$\Rightarrow x \leq a \vee b$ , for some  $a \in A$ ,  $b \in B$ .

Again  $a \in A \subseteq C$ ,  $b \in B \subseteq C$  gives  $a \vee b \in C$  and  $x \leq a \vee b$  then yields  $x \in C$ .

Hence  $X$  is the smallest ideal of  $L$  containing  $A \cup B$ ,

i.e.,  $X = \text{Sup} \{A, B\} = A \vee B$

and we have established that  $(I(L), \subseteq)$  is a lattice. It is called the ideal lattice of  $L$ . ■

**Problem 1.3.16 :** Show that an ideal of a lattice  $L$  which is also a dual ideal is the lattice itself.

**Solution :** Let  $A$  be an ideal as well as a dual ideal of  $L$ , then  $A \subseteq L$ .

We show  $L \subseteq A$ .

Let  $l \in L$ ,  $x \in A$  be any elements then  $l \wedge x \in A$ .

Again,  $l \wedge x \leq l$  and, therefore,  $l \in A$

$\Rightarrow L \subseteq A$

Hence  $A = L$ .

Thus no proper subset of a lattice can be an ideal as well as a dual ideal of the lattice. ■

**Theorem 1.3.17:** Every convex sublattice of a lattice  $L$  is the intersection of an ideal and a dual ideal.

**Proof :** Let  $S$  be a convex sublattice of  $L$

Let  $A = \{x \in L \mid \exists s \in S, x \leq s\}$ . Then  $A \neq \emptyset$  as  $S \subseteq A$ .

Notice  $s \leq s \quad \forall s \in S$ .

We show  $A$  is an ideal of  $L$ .

Let  $x, y \in A$  be any elements.

Then  $\exists s_1, s_2 \in S$  s.t.,  $x \leq s_1, y \leq s_2$

$\Rightarrow x \vee y \leq s_1 \vee s_2$

$\Rightarrow x \vee y \in A$  as  $s_1 \vee s_2 \in S$

Again, let  $x \in A$  and  $l \in L$  be any elements.

Then  $x \leq s$  for some  $s \in S$

Now  $x \wedge l \leq x \leq s$

$\Rightarrow x \wedge l \in A$

Hence  $A$  is an ideal of  $L$ .

Let  $A' = \{x \in L \mid \exists s \in S, s \leq x\}$ , then by duality it follows that  $A'$  is a dual ideal of  $L$ . We show  $S = A \cap A'$ .

$S \subseteq A \cap A'$  (by definition of  $A$  and  $A'$ )

Let  $t \in A \cap A'$ .

Then  $t \in A$  and  $t \in A'$

$\Rightarrow \exists s_1, s_2 \in S$  s.t.,  $t \in s_2, s_1 \leq t$

i.e.,  $s_1 \leq t \leq s_2$  or that  $t \in [s_1, s_2]$

Since  $S$  is convex sublattice,  $s_1, s_2 \in S$

$[s_1, s_2] \subseteq S \Rightarrow t \in S$

$\Rightarrow A \cap A' \subseteq S$

Hence  $S = A \cap A'$ . ■

**Theorem 1.3.18 :** A lattice  $L$  is a chain if and only if all ideals in  $L$  are prime.

**Proof :** Let  $L$  be a chain. Let  $A$  be any proper ideal of  $L$ . If

$a \wedge b \in A$  then as  $a, b$  are in a chain, they are comparable .

Let  $a \leq b$ . Then  $a \wedge b = a$ .

Thus  $a \wedge b \in A \Rightarrow a \in A \Rightarrow A$  is prime .

Conversely, let every ideal in  $A$  be prime. To show that  $L$  is a chain, let  $a, b \in L$  be any elements.

Let  $A = \{ x \in L \mid x \leq a \wedge b \}$  then  $A$  is easily seen to be an ideal of  $L$ . Thus  $A$  is a prime ideal.

Now  $a \wedge b \in A$ ,  $A$  is prime, thus  $a \in A$  or  $b \in A$

$\Rightarrow a \leq a \wedge b$  or  $b \leq a \wedge b$

$\Rightarrow a \wedge b \leq a \leq a \wedge b$

or  $a \wedge b \leq b \leq a \wedge b$

$\Rightarrow a = a \wedge b$  or  $b = a \wedge b$

$\Rightarrow a \leq b$  or  $b \leq a$

$\Rightarrow L$  is a chain . ■

**Definition (Dual Prime Ideal) :** A proper dual ideal  $I$  of a lattice is called a dual prime ideal if  $a \vee b \in I \Rightarrow a \in I$  or  $b \in I$ .

**Problem 1.3.19 :** Let  $I$  be a prime ideal of lattice  $L$ . Show that  $L - I$  is a dual prime ideal.

**Solution :** Since  $I$  is not empty,  $L - I$  is a proper subset of  $L$ .

Let  $a, b \in L - I$ . Then  $a, b \in L$ ,  $a, b \notin I$ .

$\Rightarrow a \wedge b \in L$ ,  $a \wedge b \notin I$

(as  $a \wedge b \in I \Rightarrow a \in I$  or  $b \in I$  as  $I$  is prime)

$\Rightarrow a \wedge b \in L - I$

Again, let  $a \in L - I$ ,  $l \in L$

Then  $a \in L$ ,  $a \notin I$ ,  $l \in L$

$\Rightarrow a \vee l \in L$ ,  $a \notin I$

$$\Rightarrow a \vee l \in L, a \vee l \notin I$$

(as  $a \vee l \in I \Rightarrow a \in I$  as  $a \leq a \vee l$ )

Thus  $a \vee l \in L - I$

i.e.,  $L - I$  is dual ideal.

Let now  $a \vee b \in L - I$ , then  $a \vee b \in L, a \vee b \notin I$

$$\Rightarrow a, b \in L, a \notin I \text{ or } b \notin I$$

(as  $a, b \in I \Rightarrow a \vee b \in I$ )

$$\Rightarrow a \in L - I \text{ or } b \in L - I$$

or that  $L - I$  is a dual prime ideal. ■

### 1.4 Complemented and Relatively Complemented Lattices .

**Definition (Complements) :** Let  $[a, b]$  be an interval in a set  $L$  .

Let  $x \in [a, b]$  be any elements. If  $\exists y \in L$  s.t.,

$$x \wedge y = a, \quad x \vee y = b .$$

We say  $y$  is a complement of  $x$  relative to  $[a, b]$ , or  $y$  is a relative complement of  $x$  in  $[a, b]$  .

**Observations :**

- (i) If such a  $y$  exists then  $y$  lies in  $[a, b]$   
as  $a = x \wedge y \leq y \leq x \vee y = b$
- (ii) If  $y$  is relative complement of  $x$  ,  $x$  will be relative complement of  $y$  .
- (iii) An element  $x$  may or may not have a relative complement .

A relative complement may or may not be unique .

Consider the pentagonal lattice given by the figure (1.9) .

Fig. 1.9

$b$  has no complement relative to  $[o, a]$

$a, b$  are both complement of  $c$  relative to  $[o, u]$

$b$  has only one complement  $c$  relative to  $[o, u]$

(iv)  $a, b$  are unique complements of each other relative to  $[a, b]$

$$a \wedge b = a, \quad a \vee b = b$$

Thus  $a, b$  are each other complements .

Let  $x$  be any other complement of  $a$  relative to  $[a, b]$

$$\text{Then } a \wedge b = a = a \wedge x$$

$$a \vee b = b = a \vee x$$

$$\text{Now } b = a \vee x = (a \wedge x) \vee x = x$$

**Definition (Complemented) :** If every element  $x$  of an interval  $[a, b]$  has at least one complement relative to  $[a, b]$ , the interval  $[a, b]$  is said to be complemented.

**Definition (Relatively Complemented) :** If every interval in a lattice is complemented the lattice is said to be relatively complemented.

Suppose now  $L$  is a bounded lattice. If for any  $x \in L$ ,  $\exists y \in L$  s.t.,  $x \wedge y = o$ ,  $x \vee y = u$ ,  $y$  is called complement of  $x$  ( we need not say relative to  $[o, u]$  ). Further, if every element of  $L$  has a complement, we say lattice is complemented.

Thus a bounded lattice is complemented if the interval  $[o, u] = L$  is complemented.

If  $L$  is a bounded lattice and is relatively complemented then  $L$  is complemented but not conversely.

Consider the pentagonal lattice,

Fig. 1.10

$[o, u]$  is complemented as  $a, c$  are each other complements  
 $b, c$  are each other complements  
 and of course,  $o, u$  are each other complements. This lattice is not relatively complemented as  $b$  has no complement relative to  $[o, a]$  and so  $[o, a]$  is not complemented.

The lattice given by the adjacent diagram is not complemented as  $a$  has no complement (relative to  $[o, u]$ ).

Fig. 1.11

The lattice given by the figure below is both relatively

complemented as well as complemented.

Fig. 1.12

**Definition (Uniquely Complemented Lattice) :** If every element of a bounded lattice  $L$  has a unique complement, we say  $L$  is uniquely complemented.

**Theorem 1.4.1 :** Let  $A$  be a non-empty finite set. Then  $(P(A), \subseteq)$  is uniquely complemented lattices.

**Proof :** Let  $A \neq \phi$  finite set and  $P(A)$  be the power set of  $A$ . We know  $(P(A), \subseteq)$  forms a lattice with least element  $\phi$  and greatest element  $A$ . Also for any  $X, Y \in P(A)$

$$X \wedge Y = X \cap Y \quad \text{and} \quad X \vee Y = X \cup Y$$

since  $X \wedge (A - X) = X \cap (A - X) = \phi$

$$X \vee (A - X) = X \cup (A - X) = A$$

We find  $A - X$  is complement of  $X$  relative to  $[\phi, A]$

Thus  $P(A)$  is complemented.

Suppose  $Y$  is any complement of  $X$ , then

$$X \wedge Y = X \cap Y = \phi$$

$$X \vee Y = X \cup Y = A$$

i.e.,  $X \cap Y = X \cap (A - X)$

$$X \cup Y = X \cup (A - X)$$

$$\Rightarrow Y = A - X$$

or that  $A - X$  is uniquely complemented of  $X$ .

So  $(P(A), \subseteq)$  is an uniquely complemented lattice.

Now we prove  $P(A)$  is also relatively complemented.

Consider any interval  $[X, Y]$  in  $P(A)$ .

Let  $Z \in [X, Y]$  be any member. Then

$$Z \cap (X \cup (Y - Z)) = (Z \cap X) \cup (Z \cap (Y - Z)) = X \cup \phi = X$$

$$Z \cup (X \cup (Y - Z)) = (Z \cup X) \cup (Y - Z) = Z \cup (Y - Z) = Y$$

Showing that  $X \cup (Y - Z)$  is complemented of  $Z$  relative to

$[X, Y]$ . Since  $C$  was any element of any interval of  $P(A)$ .

Hence  $P(A)$  is relatively complemented. ■

**Theorem 1.4.2 :** Two bounded lattices  $A$  and  $B$  are complemented if and only if  $A \times B$  is complemented.

**Proof :** Let  $A$  and  $B$  be complemented and suppose  $o, u$  and  $o', u'$  are the universal bounds of  $A$  and  $B$  respectively.

Then  $(o, o')$  and  $(u, u')$  will be least and greatest elements of  $A \times B$ .

Let  $(a, b) \in A \times B$  be any element.

Then  $a \in A, b \in B$  and as  $A, B$  are complemented,

$$\exists a' \in A, b' \in B$$

$$\text{s.t., } a \wedge a' = o, a \vee a' = u, b \wedge b' = o', b \vee b' = u'.$$

Now

$$(a, b) \wedge (a', b') = (a \wedge a', b \wedge b') = (o, o')$$

$$(a, b) \vee (a', b') = (a \vee a', b \vee b') = (u, u')$$

shows that  $(a', b')$  is complement of  $(a, b)$  in  $A \times B$ .

Hence  $A \times B$  is complemented.

Conversely, let  $A \times B$  be complemented.

Let  $a \in A, b \in B$  be any elements.

Then  $(a, b) \in A \times B$  and thus has a complement, say  $(a', b')$

$$\text{Then } (a, b) \wedge (a', b') = (o, o'), (a, b) \vee (a', b') = (u, u')$$

$$\Rightarrow (a \wedge a', b \wedge b') = (o, o'), (a \vee a', b \vee b') = (u, u')$$

$$\Rightarrow a \wedge a' = o \quad a \vee a' = u$$

$$b \wedge b' = o \quad b \vee b' = u'$$

i.e.,  $a'$  and  $b'$  are complements of  $a$  &  $b$  respectively.

Hence  $A$  and  $B$  are complemented. ■

**Theorem 1.4.3 :** Two lattices  $A$  and  $B$  are relatively complemented if and only if  $A \times B$  is relatively complemented.

**Proof :** Let  $A, B$  be relatively complemented.

Let  $[(a_1, b_1), (a_2, b_2)]$  be any interval of  $A \times B$  and suppose  $(x, y)$  is any element of this interval.

Then

$$(a_1, b_1) \leq (x, y) \leq (a_2, b_2) \quad a_1, a_2, x \in A$$

$$b_1, b_2, y \in B$$

$$\Rightarrow a_1 \leq x \leq a_2$$

$$b_1 \leq y \leq b_2$$

$$\Rightarrow x \in [a_1, a_2] \quad \text{an interval in } A$$

$y \in [b_1, b_2]$  an interval in B

Since A, B are relatively complemented, x, y have complements relative to  $[a_1, a_2]$  and  $[b_1, b_2]$  respectively.

Let  $x'$  and  $y'$  be these complements. Then

$$x \wedge x' = a_1, \quad y \wedge y' = b_1$$

$$x \vee x' = a_2, \quad y \vee y' = b_2$$

Now

$$(x, y) \wedge (x', y') = (x \wedge x', y \wedge y') = (a_1, b_1)$$

$$(x, y) \vee (x', y') = (x \vee x', y \vee y') = (a_2, b_2)$$

$\Rightarrow (x', y')$  is complement of  $(x, y)$  relative to

$$[(a_1, b_1), (a_2, b_2)].$$

Thus any interval in  $A \times B$  is complemented.

Hence  $A \times B$  is relatively complemented.

Conversely, let  $A \times B$  be relatively complemented.

Let  $[a_1, a_2]$  and  $[b_1, b_2]$  be any interval in A & B.

Let  $x \in [a_1, a_2]$ ,  $y \in [b_1, b_2]$  be any elements.

Then

$$a_1 \leq x \leq a_2, \quad b_1 \leq y \leq b_2$$

$$\Rightarrow (a_1, b_1) \leq (x, y) \leq (a_2, b_2)$$

$$\Rightarrow (x, y) \in [(a_1, b_1), (a_2, b_2)], \text{ an interval in } A \times B.$$

$$\Rightarrow (x, y) \text{ has a complement, say } (x', y') \text{ relative to this interval.}$$

Thus

$$(x, y) \wedge (x', y') = (a_1, b_1)$$

$$(x, y) \vee (x', y') = (a_2, b_2)$$

$$\Rightarrow (x \wedge x', y \wedge y') = (a_1, b_1)$$

$$(x \vee x', y \vee y') = (a_2, b_2)$$

$$\Rightarrow x \wedge x' = a_1, x \vee x' = a_2$$

$$y \wedge y' = b_1, y \vee y' = b_2$$

$$\Rightarrow x' \text{ is complement of } x \text{ relative to } [a_1, a_2]$$

$$y' \text{ is complement of } y \text{ relative to } [b_1, b_2]$$

which in turn imply that  $A, B$  are relatively complemented. ■

**Theorem 1.4.4 :** Dual of a complemented lattice is complemented.

**Proof :** Let  $(L, \rho)$  be a complemented lattice with  $o, u$  as least and greatest elements. Let  $(\bar{L}, \bar{\rho})$  be the dual of  $(L, \rho)$ . Then  $u, o$  are least and greatest elements of  $\bar{L}$ .

Let  $a \in \bar{L} = L$  be any element.

Since  $a \in L$ ,  $L$  is complemented,  $\exists a' \in L$  s.t.,

$$a \wedge a' = o, a \vee a' = u \text{ in } L$$

i.e.,  $o = \text{Inf}\{a, a'\}$  in  $L$ .

$$\Rightarrow o \rho a, o \rho a'$$

$$\Rightarrow a \bar{\rho} o, a' \bar{\rho} o \text{ in } \bar{L}$$

$$\Rightarrow o \text{ is an upper bound of } \{a, a'\} \text{ in } \bar{L}$$

If  $k$  is any upper bound of  $\{a, a'\}$  in  $\bar{L}$  then  $a \bar{\rho} k, a' \bar{\rho} k$

$$\Rightarrow k \rho a, k \rho a'$$

$$\Rightarrow k \rho o \text{ as } o \text{ is Inf.}$$

$$\Rightarrow o \bar{\rho} k$$

i.e.,  $o$  is l.u.b.  $\{a, a'\}$  in  $\bar{L}$

$$\text{i.e., } a \vee a' = o \text{ in } \bar{L}$$

similarly,  $a \wedge a' = u$  in  $\bar{L}$

or that  $a'$  is complement of  $a$  in  $\bar{L}$

Hence  $\bar{L}$  is complemented. ■

### 1.5 Atoms and Covers .

**Definition ( Atom ) :** An element  $a$  in a lattice  $L$  is called an atom if it covers  $o$ .

In other words  $a$  is an atom if and only if  $a \neq 0$  and  $x \wedge a = a$  or  $x \vee a = 0 \quad \forall x \in L$ .

**Definition ( Dual atom ) :** An element  $b$  is called dual atom, if  $u$ , the greatest element of the lattice covers  $b$ .

**Definition ( Length ) :** A finite chain with  $n$  elements is said to have length  $n - 1$ , ( i.e., length is the number of 'links' that the chain has. )

**Definition ( Cover ) :** We say  $a$  covers  $b$  if  $b < a$  and there exists no  $c$  s.t.,  $b < c < a$ .

**Definition ( Height or dimension ) :** Let  $L$  be a lattice of finite length with least element  $o$ . An element  $x \in L$  is said to have height or dimension  $n$  if  $l [ o, x ] = n$  and, in that case we write  $h ( x ) = n$ .

**Problem 1.5.1 :** Show that no ideal of a complemented lattice which is a proper sublattice can contain both an element and its complement.

**Solution :** Let  $L$  be a complemented lattice. Then  $o, u \in L$ . Let  $I$  an ideal of  $L$  such that  $I$  is a proper sub lattice of  $L$ . Suppose  $\exists$  an element  $x$  in  $I$  such that its complement  $x'$  is also in  $I$ .

Then

$$x \wedge x' = o, \quad x \vee x' = u$$

since  $I$  is sublattice,  $x \wedge x'$ ,  $x \vee x'$  are in  $I$  i.e.,  $o, u \in I$

Now if  $l \in L$  be any element then as  $u \in I$

$$l \wedge u \in I$$

$$\Rightarrow l \in I \Rightarrow L \subseteq I$$

$$\Rightarrow I = L, \text{ a contradiction.} \quad \blacksquare$$

**Problem 1.5.2 :** Let  $L$  be uniquely complemented lattice and let  $a$  be an atom in  $L$ . Show that  $a'$  the complement of  $a$  is a dual atom of  $L$ .

**Solution :** Since  $L$  is uniquely complemented lattice, every element has a unique complement.

Suppose  $a'$  is not a dual atom, then  $\exists$  at least one  $x$

$$\text{s.t., } a' < x < u$$

$$\Rightarrow a' \vee a \leq x \vee a$$

$$\Rightarrow u \leq x \vee a \leq u$$

$$\Rightarrow u = x \vee a.$$

Now if  $a \leq x$  then  $x \vee a = x$

$$\Rightarrow x = u, \text{ not true. Again if } a \not\leq x, \text{ then}$$

$$a \wedge x = o \text{ (note } a \text{ is an atom)}$$

thus  $a \wedge x = o, a \vee x = u$

$$\Rightarrow x = a', \text{ again a contradiction.}$$

Hence  $a'$  is a dual atom.  $\blacksquare$

---

**“Homomorphisms and Isomorphisms”**

**2.1 Introduction .**

Here we discuss Homomorphisms , Isomorphisms , Meet homomorphisms and Join homomorphisms . We have prove the following problem .If  $L_1, L_2, M_1, M_2$  are lattices such that  $L_1 \cong M_1$  and  $L_2 \cong M_2$  then show that  $L_1 \times L_2 \cong M_1 \times M_2 \cong M_2 \times M_1$ .

Let  $\theta : L \longrightarrow M$  be an onto homomorphism . The set  $\{ x \in L \mid \theta ( x ) = 0' \}$  where  $0'$  is the least element of  $M$  is called the Kernel of  $\theta$  and is denoted by  $\text{Ker}\theta$  . If  $M$  does not have the zero element ,  $\text{Ker}\theta$  does not exist .

**2.2 Meet and Join Homomorphisms , Isomorphisms .**

**Definition ( Meet & Join homomorphism ) :** Let  $L$  and  $M$  be lattices.

A mapping  $\theta : L \longrightarrow M$  is called a meet homomorphism if

$$\theta ( a \wedge b ) = \theta ( a ) \wedge \theta ( b ) .$$

It is called a join homomorphism if

$$\theta ( a \vee b ) = \theta ( a ) \vee \theta ( b ) .$$

**Definition ( Homomorphism ) :** If  $\theta$  is both meet as well as join homomorphism, it is called a homomorphism .

A homomorphism is also sometimes called a morphism.

**Definition ( Isomorphism ) :** The map  $\theta$  is also 1-1 and onto we call  $\theta$  to be an isomorphism.

If  $\theta$  is an isomorphism from  $L$  to  $L$  we call it an automorphism.

A homomorphism from  $L$  to  $L$  is called endomorphism.

If  $\theta : L \longrightarrow M$  is onto homomorphism, we say  $M$  homomorphic image of  $L$ .

**Example 2.2.1 :** Let  $L$  and  $M$  be lattices

Fig. 2.1

Define  $\theta : L \longrightarrow M$ , s. t.,

$$\theta(o) = p \quad \theta(a) = q$$

$$\theta(b) = p \quad \theta(u) = q$$

Then  $\theta$  is a homomorphism .

$$\theta(a \wedge b) = \theta(o) = p, \quad \theta(a) \wedge \theta(b) = q \wedge p = p$$

$$\theta(a \vee b) = \theta(u) = q, \quad \theta(a) \vee \theta(b) = q \vee p = q.$$

**Problem 2.2.1 :** If  $L_1, L_2, M_1, M_2$  are lattices such that  $L_1 \cong M_1$  and  $L_2 \cong M_2$  then show that  $L_1 \times L_2 \cong M_1 \times M_2 \cong M_2 \times M_1$ .

**Solution :** Let  $f : L_1 \longrightarrow M_1$  and  $g : L_2 \longrightarrow M_2$  be the given isomorphisms . Define

$$\theta : L_1 \times L_2 \longrightarrow M_1 \times M_2, \text{ s. t.,}$$

$$\theta((a, b)) = (f(a), g(b))$$

$$\text{Then } \theta((a, b)) = \theta((c, d))$$

$$\Leftrightarrow (f(a), g(b)) = (f(c), g(d))$$

$$\Leftrightarrow f(a) = f(c), \quad g(b) = g(d)$$

$$\Leftrightarrow a = c, \quad b = d$$

$$\Leftrightarrow (a, b) = (c, d)$$

Shows that  $\theta$  is well defined 1-1 map.

$$\begin{aligned} \text{Again, } \theta((a, b) \wedge (c, d)) &= \theta((a \wedge c, b \wedge d)) \\ &= (f(a \wedge c), g(b \wedge d)) \\ &= (f(a) \wedge f(c), g(b) \wedge g(d)) \\ &= (f(a), g(b)) \wedge (f(c), g(d)) \\ &= \theta((a, b)) \wedge \theta((c, d)) \end{aligned}$$

$$\text{Similarly, } \theta((a, b) \vee (c, d)) = \theta((a, b)) \vee \theta((c, d))$$

Showing thereby that  $\theta$  is a homomorphism.

Finally, for any  $(m_1, m_2) \in M_1 \times M_2$ , since  $m_1 \in M_1$  &  $m_2 \in M_2$  and  $f, g$  are onto,

$$\begin{aligned} \exists l_1 \in L_1, l_2 \in L_2, \text{ s. t., } f(l_1) &= m_1, g(l_2) = m_2 \\ \text{and } \theta((l_1, l_2)) &= (f(l_1), g(l_2)) = (m_1, m_2) \end{aligned}$$

shows that  $\theta$  is onto and hence an isomorphism.

To show  $M_1 \times M_2 \cong M_2 \times M_1$ , we can define

$$\begin{aligned} \varphi : M_1 \times M_2 &\longrightarrow M_2 \times M_1 \text{ s. t.,} \\ \varphi((m_1, m_2)) &= (m_2, m_1) \end{aligned}$$

It is now easy to verify that  $\varphi$  is an isomorphism. ■

**Theorem 2.2.2 :** If  $\theta : L \longrightarrow M$  is onto homomorphism and

$$\begin{aligned} x, y \in M \text{ s. t., } x < y \text{ then } \exists a, b \in L \text{ s. t., } \theta(a) &= x, \\ \theta(b) &= y \text{ and } a < b. \end{aligned}$$

**Proof :** Since  $\theta$  is onto and  $x, y \in M$ ,  $\exists a, c$  in  $L$  s. t.,

$$\theta(a) = x, \quad \theta(c) = y$$

$$\text{We have } \theta(a \vee c) = \theta(a) \vee \theta(c) = x \vee y = y \text{ as } x < y.$$

And  $a \leq a \vee c$

If  $a = a \vee c$  then  $\theta(a) = \theta(a) \vee \theta(c) = y$

$\Rightarrow x = y$  which is not true .

Thus  $a < a \vee c$ .

Take  $b = a \vee c$  and we have the result proved. ■

**Theorem 2.2.3 :** Homomorphic image of a relatively complemented lattice is relatively complemented .

**Proof :** Let  $\theta : L \longrightarrow M$  be an onto homomorphism and suppose  $L$  is relatively complemented.

Let  $[a', b']$  be any interval in  $M$ , since  $\theta$  is onto homomorphism,  $\exists$  pre images  $a$  and  $b$  for  $a', b'$  respectively such that  $\theta(a) = a', \theta(b) = b'$  and  $a < b$  (as  $a' < b'$ ).

Thus  $[a, b]$  is an interval in  $L$ .

Let  $y \in [a', b'] = [\theta(a), \theta(b)]$  be any element then as before  $\exists$  a pre image  $x$  of  $y$  s.t.,  $\theta(x) = y$  and  $a \leq x \leq b$ .

Now  $L$  relatively complemented implies that  $x$  has a complement  $x'$  relative to  $[a, b]$ ,

i . e.,  $x \wedge x' = a, x \vee x' = b$

$\Rightarrow \theta(x) \wedge \theta(x') = \theta(a), \theta(x) \vee \theta(x') = \theta(b)$

$\Rightarrow y \wedge \theta(x') = a', y \vee \theta(x') = b'$

$\Rightarrow \theta(x')$  is complement of  $y$  relative to  $[a', b']$ .

Thus each element in any interval in  $M$  has a complement, giving us the required result. ■

### 2.3 Embeddings , Kernels and Dual homomorphisms .

**Definition ( Embedding ) :** Let  $L, M$  be lattices. A one – one homomorphism  $\theta : L \longrightarrow M$  is called an imbedding ( embedding ) mapping . Also in that case we say  $L$  is imbedded in  $M$ .

**Theorem 2.3.1 :** Any lattice can be imbedded into its ideal lattice.

**Proof :** Let  $I(L)$  be the ideal lattice of  $L$ .

Define  $\theta : L \longrightarrow I(L)$ , s . t . ,

$\theta(a) = (a]$ , the principal ideal generated by  $a$  .

$\theta$  is then clearly well defined.

Also  $\theta(a) = \theta(b)$

$\Rightarrow (a] = (b]$

and  $a \in (a] \Rightarrow a \in (b] \Rightarrow a \leq b$

Similarly  $b \leq a$  and thus  $a = b$  i.e.,  $\theta$  is one-one.

Again  $\theta(a \wedge b) = (a \wedge b] = (a] \wedge (b] = \theta(a) \wedge \theta(b)$

$\theta(a \vee b) = (a \vee b] = (a] \vee (b] = \theta(a) \vee \theta(b)$

Hence  $\theta$  is one-one homomorphism. ■

**Definition ( Kernel ) :** Let  $\theta : L \longrightarrow M$  be an onto homomorphism .

The set  $\{x \in L \mid \theta(x) = o'\}$  where  $o'$  is least element of  $M$  is called Kernel of  $\theta$  and is denoted by  $\text{Ker } \theta$ . If  $M$  does not have the zero element,  $\text{Ker } \theta$  does not exist.

**Theorem 2.3.2 :** If  $\theta : L \longrightarrow M$  is an onto homomorphism, where  $L, M$  are lattices and  $o'$  is the least element of  $M$ , then  $\text{Ker } \theta$  is an ideal of  $L$ .

**Proof :** Since  $\theta$  is onto,  $o' \in M$ , thus  $\text{Ker } \theta \neq \emptyset$  as pre image of  $o'$  exists in  $L$ .

Now  $x, y \in \text{Ker } \theta$

$$\Rightarrow \theta(x) = o' = \theta(y)$$

$$\theta(x \vee y) = \theta(x) \vee \theta(y) = o' \vee o' = o'$$

$$\Rightarrow x \vee y \in \text{Ker } \theta.$$

Again  $x \in \text{Ker } \theta, 1 \in L$ , gives  $\theta(x) = o'$ .

$$\text{Also } \theta(x \wedge 1) = \theta(x) \wedge \theta(1) = o' \wedge 1 = o'$$

$$\Rightarrow x \wedge 1 \in \text{Ker } \theta.$$

Hence  $\text{Ker } \theta$  is an ideal of  $L$ . ■

**Theorem 2.3.3 :** If  $\theta : L \longrightarrow L$  be a homomorphism, where  $L$  is a complete lattice then  $\exists$  some  $a \in L$ , s. t.,  $\theta(a) = a$ .

**Proof :** Let  $S = \{x \in L \mid x \leq \theta(x)\}$ .

Then  $S \neq \emptyset$  as  $o \in S$  as  $o \leq \theta(o)$  (Note  $\theta(o) \in L$ ).

Thus  $S$  is a non empty subset of a complete lattice and therefore

$\text{Sup } S$  exists. Let  $\text{Sup } S = a$ .

$$\text{Now } x \leq a \quad \forall x \in S$$

$$\Rightarrow \theta(x) \leq \theta(a) \quad \forall x \in S$$

$$\Rightarrow x \leq \theta(x) \leq \theta(a) \quad \forall x \in S$$

$$\Rightarrow \theta(a) \text{ is an upper bound of } S$$

$$\Rightarrow a \leq \theta(a) \quad (\text{Def. of } \text{Sup})$$

$$\Rightarrow a \in S \text{ by def. of } S \text{ and hence } a \text{ is greatest}$$

element of  $S$ .

$$\text{Also } a \leq \theta(a) \Rightarrow \theta(a) \leq \theta(\theta(a))$$

$$\Rightarrow \theta(a) \in S \quad (\text{Def. of } S)$$

$a$  being greatest element of  $S$  then gives  $\theta(a) \leq a$

$$\text{i. e., } a \leq \theta(a) \leq a.$$

Hence  $\theta(a) = a$ , which proves our assertion. ■

**Definition ( Dual meet & Dual join homomorphism ) :** A mapping

$\theta : L \longrightarrow M$  is called dual meet homomorphism if

$$\theta(a \wedge b) = \theta(a) \vee \theta(b).$$

and is called dual join homomorphism if

$$\theta(a \vee b) = \theta(a) \wedge \theta(b).$$

**Definition ( Dual homomorphism ) :** It is called a dual homomorphism if it satisfies both the above conditions.

**Definition ( Dual Isomorphism ) :** A 1-1 onto dual homomorphism is called a dual isomorphism.

The reader would recall that under posets we define a dual isomorphism to be a 1-1 onto map which satisfies  $a R b \Leftrightarrow \theta(b) R' \theta(a)$  where  $R$  and  $R'$  are the relations in  $L$  and  $M$ .

**Theorem 2.3.4 :** The definition of dual meet homomorphism & dual join homomorphism are equivalent.

**Proof :** To show the equivalence of two definitions,

Let  $\theta : L \longrightarrow M$  be 1-1 onto s. t.,

$$\theta(a \wedge b) = \theta(a) \vee \theta(b)$$

$$\theta(a \vee b) = \theta(a) \wedge \theta(b)$$

Let  $a R b$  in  $L$

$$\Rightarrow a = a \wedge b$$

$$\Rightarrow \theta(a) = \theta(a) \vee \theta(b) \text{ in } M$$

$$\Rightarrow \theta(b) R' \theta(a)$$

$$\text{Again } \theta(b) R' \theta(a) \Rightarrow \theta(a) = \theta(a) \vee \theta(b) = \theta(a \wedge b).$$

$$\Rightarrow a = a \wedge b \text{ as } \theta \text{ is 1-1}$$

$\Rightarrow a R b \text{ in } L$

Conversely, let  $a, b \in L$  be any elements.

Then  $(a \wedge b) R a, (a \wedge b) R b$

$\Rightarrow \theta(a) R' \theta(a \wedge b), \theta(b) R' \theta(a \wedge b)$

or that  $\theta(a \wedge b)$  is an upper bound of  $\{\theta(a), \theta(b)\}$

Suppose  $y \in M$  is any upper bound of  $\{\theta(a), \theta(b)\}$  then

since  $\theta$  is onto,  $\exists x \in L$  s.t.,  $\theta(x) = y$ .

Now  $\theta(x)$  is an upper bound of  $\{\theta(a), \theta(b)\}$  gives

$\theta(a) R' \theta(x), \theta(b) R' \theta(x)$

$\Rightarrow x R a, x R b$

$\Rightarrow x$  is a lower bound of  $\{a, b\}$

$\Rightarrow x R (a \wedge b), a \wedge b = \text{Inf}\{a, b\}$

$\Rightarrow \theta(a \wedge b) R' \theta(x) = y$

i. e.,  $\theta(a \wedge b)$  is a least upper bound of  $\{\theta(a), \theta(b)\}$

i. e.,  $\theta(a \wedge b) = \theta(a) \vee \theta(b)$ .

Similarly we can show  $\theta(a) \wedge \theta(b) = \theta(a \vee b)$ .

Hence the two definitions are equivalent. ■

### “Modular Lattices and Distributive Lattices”

#### 3.1 Introduction .

Modular lattices and Distributive lattices have been studied extensively by many authors including Cigonli- [ 4 ], Cornish [ 5 ], Evans [ 7 ], [ 8 ] and Nieminen [ 15 ], [ 16 ]. A lattice  $L$  is called a modular lattice if for all  $a, b, c \in L$  with  $a \geq b$

$$a \wedge (b \vee c) = [ b \vee (a \wedge c) ]$$

In this chapter we also prove any non modular lattice  $L$  contains a sub-isomorphic with the pentagonal lattice . Two intervals  $[ a , b ]$  and  $[ c , d ]$  of a lattice are called transposed if  $b \wedge c = a$  and  $b \vee c = d$  .

#### 3.2 Modular Lattices .

**Definition ( Modular lattice ) :** A lattice  $L$  is called a modular lattice if

$$\forall a, b, c \in L, \text{ with } a \geq b$$

$$a \wedge (b \vee c) = [ b \vee (a \wedge c) ]$$

( Dual of a modularity will read as

$$\text{For } a, b, c \in L \text{ with } a \leq b, a \vee (b \wedge c) = b \wedge (a \vee c)$$

Hence dual of a modular lattice is modular )

**Example 3.2.1 :** The lattice given by the following diagram are modular .

Fig. 3.1

Fig. 3.2

**Example 3.2.2 :** A chain is a modular lattice .

**Theorem 3.2.1 :** A sublattice of a modular lattice is modular.

**Proof :** Let  $S$  be a sublattice of a modular lattice  $L$ . If  $a, b, c \in S$

with  $a \geq b$  then as  $S \subseteq L$ ,  $a, b, c \in L$  and, therefore,

$$a \wedge (b \vee c) = b \vee (a \wedge c).$$

Since  $S$  is closed under  $\wedge$  and  $\vee$  this result holds in  $S$  and hence  $S$  is modular. ■

**Problem 3.2.2 :** Show that a lattice of length two is modular.

**Solution :** If a lattice  $L$  has length 2, then  $l[o, u] = 2$  and thus

$$l[a, b] \leq 2 \text{ for any } a, b \in L, a \leq b.$$

Let  $a, b, c \in L$  be three elements s. t.,  $a > b$  and  $c$  is not comparable with  $a$  or  $b$ . Then  $b \wedge c < b < a < a \vee c$  (at no place equality holds). Which shows  $l[b \wedge c, a \vee c] \geq 3$ , which is not possible. Thus we cannot find any triplet  $a, b, c$  in  $L$  s. t.,  $a > b$  and  $c$  is not comparable with  $a$  or  $b$ . Hence  $L$  is modular. ■

**Theorem 3.2.3 :** Homomorphic image of a modular lattice is modular.

**Proof :** Let  $\theta : L \longrightarrow M$  be an onto homomorphism and suppose

$L$  is modular. Let  $x, y, z \in M$  be three elements with  $x > y$ .

Since  $\theta$  is onto homomorphism,  $\exists a, b, c \in L$  s. t.,  $\theta(a) = x$ ,

$\theta(b) = y$ ,  $\theta(c) = z$ , where  $a > b$ .

Now  $L$  is modular,  $a, b, c \in L$ ,  $a > b$ , thus we get

$$a \wedge (b \vee c) = b \vee (a \wedge c)$$

$$\text{Now } x \wedge (y \vee z) = \theta(a) \wedge (\theta(b) \vee \theta(c))$$

$$= \theta(a) \wedge (\theta(b \vee c))$$

$$= \theta(a \wedge (b \vee c))$$

$$\begin{aligned}
&= \theta(b \vee (a \wedge c)) \\
&= \theta(b) \vee \theta(a \wedge c) \\
&= \theta(b) \vee [\theta(a) \wedge \theta(c)] \\
&= y \vee (x \wedge z)
\end{aligned}$$

Hence  $M$  is modular. ■

**Theorem 3.2.4 :** Two lattices  $L$  and  $M$  are modular if and only if

$L \times M$  is modular.

**Proof :** Let  $L$  and  $M$  be modular.

Let  $(a_1, b_1), (a_2, b_2), (a_3, b_3) \in L \times M$  be three elements with  $(a_1, b_1) \geq (a_2, b_2)$ .

Then  $a_1, a_2, a_3 \in L, \quad a_1 \geq a_2$

$b_1, b_2, b_3 \in M, \quad b_1 \geq b_2$

and since  $L$  and  $M$  are modular, we get

$$a_1 \wedge (a_2 \vee a_3) = a_2 \vee (a_1 \wedge a_3)$$

$$b_1 \wedge (b_2 \vee b_3) = b_2 \vee (b_1 \wedge b_3)$$

Thus

$$\begin{aligned}
(a_1, b_1) \wedge [(a_2, b_2) \vee (a_3, b_3)] &= (a_1, b_1) \wedge (a_2 \vee a_3, b_2 \vee b_3) \\
&= (a_1 \wedge (a_2 \vee a_3), b_1 \wedge (b_2 \vee b_3)) \\
&= (a_2 \vee (a_1 \wedge a_3), b_2 \vee (b_1 \wedge b_3)) \\
&= (a_2, b_2) \vee (a_1 \wedge a_3, b_1 \wedge b_3) \\
&= (a_2, b_2) \vee [(a_1, b_1) \wedge (a_3, b_3)]
\end{aligned}$$

Hence  $L \times M$  is modular.

Conversely, let  $L \times M$  be modular.

Let  $a_1, a_2, a_3 \in L, \quad a_1 \geq a_2$

$b_1, b_2, b_3 \in M, \quad b_1 \geq b_2$

then  $(a_1, b_1), (a_2, b_2), (a_3, b_3) \in L \times M$  and

$$(a_1, b_1) \geq (a_2, b_2).$$

Since  $L \times M$  is modular, we find

$$(a_1, b_1) \wedge [(a_2, b_2) \vee (a_3, b_3)] = (a_2, b_2) \vee [(a_1, b_1) \wedge (a_3, b_3)]$$

$$\text{or } (a_1, b_1) \wedge (a_2 \vee a_3, b_2 \vee b_3) = (a_2, b_2) \vee (a_1 \wedge a_3, b_1 \wedge b_3)$$

$$\text{or } (a_1 \wedge (a_2 \vee a_3), b_1 \wedge (b_2 \vee b_3)) = (a_2 \vee (a_1 \wedge a_3), b_2 \vee (b_1 \wedge b_3))$$

$$\Rightarrow a_1 \wedge (a_2 \vee a_3) = a_2 \vee (a_1 \wedge a_3)$$

$$b_1 \wedge (b_2 \vee b_3) = b_2 \vee (b_1 \wedge b_3)$$

$\Rightarrow L$  and  $M$  are modular. ■

**Theorem 3.2.5 :** A lattice  $L$  is modular if and only if  $I(L)$ , the ideal lattice of  $L$  is modular.

**Proof :** Let  $L$  be modular.

Let  $A, B, C \in I(L)$  be three members s. t.,  $B \subseteq A$ .

We show  $A \cap (B \vee C) = B \vee (A \cap C)$

Let  $x \in A \cap (B \vee C)$  be any element.

Then  $x \in A$  and  $x \in B \vee C$ .

$\Rightarrow x \in A$  and  $x \leq b \vee c$  for some  $b \in B, c \in C$

Since  $b \in B \subseteq A$ ,  $x \vee b \in A$ . Let  $x \vee b = a$

Now  $x \leq b \vee c$ ,  $x \leq a \Rightarrow x \leq a \wedge (b \vee c)$

$\Rightarrow x \leq b \vee (a \wedge c)$  as  $a \geq b$  &  $L$  is modular.

Again,  $a \wedge c \leq a$ ,  $a \in A \Rightarrow a \wedge c \in A$

$a \wedge c \leq c$ ,  $c \in C \Rightarrow a \wedge c \in C$

Thus  $a \wedge c \in A \cap C$  and as  $b \in B$  we find  $x \in B \vee (A \cap C)$

i. e.,  $A \cap (B \vee C) \subseteq B \vee (A \cap C)$

$B \vee (A \cap C) \subseteq A \cap (B \vee C)$  follows by modular inequality,

or to prove independently, let  $y \in B \vee (A \cap C)$ .

Then  $y \leq b \vee k$  where  $b \in B, k \in A \cap C$

Thus  $y \leq b \vee k$ , ( $b \in B \subseteq A, k \in A \Rightarrow b \vee k \in A$ )

$\Rightarrow y \in A$

Also  $y \leq b \vee k, b \in B, k \in C \Rightarrow y \in B \vee C$

i. e.,  $y \in A \cap (B \vee C)$

Showing that  $B \vee (A \cap C) \subseteq A \cap (B \vee C)$

Hence  $A \wedge (B \cup C) = B \vee (A \cap C)$  or that  $I(L)$  is modular.

Conversely, let  $I(L)$  be modular. Since  $L$  can be imbedded into  $I(L)$ , it is isomorphic to a sublattice of  $I(L)$ . This sublattice must be modular as  $I(L)$  is modular. Hence  $L$  is modular. ■

**Theorem 3.2.6 :** If  $a, b$  are any elements of a modular lattice  $L$  then

$$[a \wedge b, a] \cong [b, a \vee b].$$

**Proof :** We know that an interval in a lattice is a sublattice. We establish the isomorphism.

Define a map  $\psi : [a \wedge b, a] \longrightarrow [b, a \vee b]$ , s. t.,

$$\psi(x) = x \vee b, \quad x \in [a \wedge b, a].$$

Then  $\psi$  is well defined as

$$\begin{aligned} x \in [a \wedge b, a] &\Rightarrow a \wedge b \leq x \leq a \\ &\Rightarrow (a \wedge b) \vee b \leq x \vee b \leq a \vee b \\ &\Rightarrow b \leq x \vee b \leq a \vee b \\ &\Rightarrow x \vee b \in [b, a \vee b] \end{aligned}$$

Also  $x_1 = x_2 \Rightarrow x_1 \vee b = x_2 \vee b$

$$\Rightarrow \psi(x_1) = \psi(x_2).$$

$\psi$  is one - one as

Let  $\psi(x_1) = \psi(x_2)$  [ So  $x_1, x_2 \in [a \wedge b, a]$  ]

Then  $x_1 \vee b = x_2 \vee b$

$$\Rightarrow a \wedge (x_1 \vee b) = a \wedge (x_2 \vee b)$$

$$\Rightarrow x_1 \vee (a \wedge b) = x_2 \vee (a \wedge b) \quad \text{using modularity, } a \geq x_1, x_2$$

$$\Rightarrow x_1 = x_2 \quad \text{as } a \wedge b \leq x_1, x_2$$

$\psi$  is onto as

Let  $y \in [b, a \vee b]$  be any element. We show  $a \wedge y$  is the required pre image.

$$y \in [b, a \vee b] \Rightarrow b \leq y \leq a \vee b$$

$$\Rightarrow a \wedge b \leq a \wedge y \leq a \wedge (a \vee b)$$

$$\Rightarrow a \wedge y \in [a \wedge b, a]$$

Also  $\psi(a \wedge y) = (a \wedge y) \vee b$ .

So we need show  $y = (a \wedge y) \vee b$ .

Now  $y \leq a \vee b \Rightarrow y \wedge (a \vee b) = y$

$$\Rightarrow y = y \wedge (b \vee a) = b \vee (y \wedge a) \quad (\text{using modularity})$$

Hence  $\psi$  is onto.

Again,  $x_1 \leq x_2 \Rightarrow x_1 \vee b \leq x_2 \vee b$

$$\Rightarrow \psi(x_1) \leq \psi(x_2)$$

And  $\psi(x_1) \leq \psi(x_2)$

$$\Rightarrow x_1 \vee b \leq x_2 \vee b$$

$$\Rightarrow a \wedge (x_1 \vee b) \leq a \wedge (x_2 \vee b)$$

$$\Rightarrow x_1 \vee (a \wedge b) \leq x_2 \vee (a \wedge b)$$

$$\Rightarrow x_1 \leq x_2$$

Thus  $x_1 \leq x_2 \Leftrightarrow \psi(x_1) \leq \psi(x_2)$ .

Hence  $\psi$  is an isomorphism. ■

**Definition ( Transposed ) :** Two intervals  $[a, b]$  and  $[c, d]$  of a lattice are called transposed if  $b \wedge c = a$  and  $b \vee c = d$ .

**Theorem 3.2.7 :** Any non modular lattice  $L$  contains a sublattice isomorphic with the pentagonal lattice.

**Proof :** Since  $L$  is non modular  $\exists$  at least three elements  $a, b, c$   $a \geq b$  s.t.,  $a \wedge (b \vee c) \neq b \vee (a \wedge c)$ .

In view of the remarks of definition, we must have  $a > b$ , and as in any lattice the modular lattice inequality ( $a \geq b, a \wedge (b \vee c) \geq b \vee (a \wedge c)$ ) holds, we get  $a \wedge (b \vee c) > b \vee (a \wedge c)$ .

Consider the chain

$$a \wedge c \leq b \vee (a \wedge c) < a \wedge (b \vee c) \leq b \vee c \quad \text{---- (1)}$$

We show at all place, strict inequality holds.

Suppose  $a \wedge c = b \vee (a \wedge c)$

Then  $b \leq a \wedge c$  ( $x = y \vee x \Rightarrow y \leq x$ )

$$\Rightarrow b \vee c \leq (a \wedge c) \vee c$$

$$\Rightarrow b \vee c \leq c \leq b \vee c$$

$$\Rightarrow b \vee c = c$$

$$\Rightarrow a \wedge (b \vee c) = a \wedge c, \quad \text{a contradiction to (1)}$$

Thus  $a \wedge c < b \vee (a \wedge c)$ . Similarly  $a \wedge (b \vee c) < b \vee c$ .

Hence chain (1) becomes .

$$a \wedge c < b \vee (a \wedge c) < a \wedge (b \vee c) < b \vee c \quad \text{----- (2)}$$

Consider now the chain

$$a \wedge c \leq c \leq b \vee c$$

As seen above  $b \vee c = c$  leads to a contradiction and similarly

$a \wedge c = c$  would give a contradiction.

$$\text{Hence } a \wedge c < c < b \vee c \quad \text{----- (3)}$$

We thus have two chains (2) and (3) with same end points.

We show  $c$  does not lie in chain (2). For this it is sufficient to prove that  $c$  is not comparable with  $a \wedge (b \vee c)$ .

$$\text{Suppose } a \wedge (b \vee c) \leq c$$

$$\text{Then } a \wedge (a \wedge (b \vee c)) \leq a \wedge c$$

$$\Rightarrow a \wedge (b \vee c) \leq a \wedge c \quad \text{a contradiction to (2)}$$

$$\text{Again, if } a \wedge (b \vee c) > c$$

$$\text{then as } a \geq a \wedge (b \vee c)$$

We find  $a > c$  which gives  $a \wedge c = c$ , a contradiction to (3).

Hence the chain (2) and (3) form a pentagonal subset

$$S = \{ a \wedge c, b \vee (a \wedge c), a \wedge (b \vee c), b \vee c, c \} \text{ of } L.$$

Fig. 3.3

We show now this pentagonal subset is a sublattice. For that meet and join of any two elements of  $S$  should lie inside  $S$ . Meet and join of any two comparable elements being one of them is clearly in  $S$ .

$$\text{Now } [a \wedge (b \vee c)] \wedge c = a \wedge [(b \vee c) \wedge c] = a \wedge c \in S$$

$$\text{Also } [a \wedge (b \vee c)] \vee c \geq [b \vee (a \wedge c)] \vee c \text{ by (2)}$$

$$= b \vee [(a \wedge c) \vee c] = b \vee c$$

and  $a \wedge (b \vee c) \leq b \vee c$  gives

$$(a \wedge (b \vee c)) \vee c \leq (b \vee c) \vee c = b \vee c$$

Thus  $[a \wedge (b \vee c)] \vee c = b \vee c \in S$ .

Similarly, we can show  $[b \vee (a \wedge c)] \vee c = b \vee c \in S$

$$[b \vee (a \wedge c)] \wedge c = a \wedge c \in S$$

Hence  $S$  forms a sublattice of  $L$ . ■

**Theorem 3.2.8 :** A lattice  $L$  is modular if and only if for  $a, b, c \in L$ , the three relations  $a \geq b$ ,  $a \wedge c = b \wedge c$ ,  $a \vee c = b \vee c$  imply  $a = b$ .

**Proof :** Let  $L$  be modular and suppose  $a, b, c \in L$  are such that  $a \geq b$ ,  $a \wedge c = b \wedge c$ ,  $a \vee c = b \vee c$ .

$$\begin{aligned} \text{Then } a &= a \wedge (a \vee c) = a \wedge (b \vee c) = b \vee (a \wedge c) \\ &= b \vee (b \wedge c) = b. \quad (\text{using modularity and absorption}) \end{aligned}$$

Conversely, suppose the condition holds. We want to show that  $L$  is modular. Suppose  $L$  is not modular. Then by above theorem  $\exists$  a pentagonal sublattice

$$\{a \wedge c, b \vee (a \wedge c), a \wedge (b \vee c), b \vee c, c\} \text{ in } L$$

where  $a \wedge (b \vee c) > b \vee (a \wedge c)$

Put  $a \wedge (b \vee c) = x$  and  $b \vee (a \wedge c) = y$  then  $x > y$ .

Thus we have the three relations

$$x \geq y, \quad x \wedge c = y \wedge c (= a \wedge c)$$

$$x \vee c = y \vee c (= a \vee c).$$

Thus by given condition, we must have  $x = y$  which implies

$$a \wedge (b \vee c) = b \vee (a \wedge c) \text{ a contradiction.}$$

Hence  $L$  must be modular. ■

**Theorem 3.2.9 :** A lattice  $L$  is modular if and only if no interval  $[x, y]$  of  $L$  contains an element which has two different comparable complements relative to  $[x, y]$ .

**Proof :** Suppose  $L$  is modular. Suppose  $[x, y]$  is an interval in  $L$  such that an element  $c$  in  $[x, y]$  has two comparable complements  $a, b$  ( $a \geq b$ ) relative to  $[x, y]$ .

$$\text{Then } c \wedge a = c \wedge b (=x)$$

$$c \vee a = c \vee b (=y)$$

$$\begin{aligned} \text{Thus } a &= a \wedge (a \vee c) = a \wedge (b \vee c) = b \vee (a \wedge c) \\ &= b \vee (b \wedge c) \\ &= b. \end{aligned}$$

i. e., no interval can contain an element which has two different comparable complements relative to the interval.

Conversely, let the given condition hold. Suppose  $L$  is not modular.

Then  $L$  contains a pentagonal sublattice

$$\{ a \wedge c, b \vee (a \wedge c), a \wedge (b \vee c), b \vee c, c \}$$

$$\text{Put } a \wedge (b \vee c) = t,$$

$$b \vee (a \wedge c) = r, \text{ then } t > r$$

$$\text{Also } t \wedge c = r \wedge t = a \wedge c = x \text{ (say)}$$

$$t \vee c = r \vee t = b \vee c = y \text{ (say)}$$

$$t = t \wedge c \leq t \vee c = y$$

$$\Rightarrow x \leq y$$

i. e.,  $\exists$  an interval  $[x, y]$  in  $L$  which has an element  $c$

$$[x = t \wedge c \leq c \leq t \vee c = y],$$

with two different comparable complements  $t$  and  $r$  relative to

$[x, y]$  a contradiction.

Hence  $L$  is modular. ■

**Theorem 3.2.10 :** A complemented modular lattice is relatively complemented.

**Proof :** Let  $L$  be a complemented modular lattice.

Let  $[a, b]$  be any interval in  $L$  and  $x \in [a, b]$  be any element. Since  $L$  is complemented,  $x$  has a complement, say,  $x'$ .

Then  $x \wedge x' = o$ ,  $x \vee x' = u$ ,  $a \leq x \leq b$ .

Take  $y = a \vee (b \wedge x')$

Then  $x \wedge y = x \wedge [a \vee (b \wedge x')]$

$$= a \vee (x \wedge (b \wedge x')) \quad [\text{as } x \geq a, L \text{ is modular}]$$

$$= a \vee (b \wedge x \wedge x')$$

$$= a \vee (b \wedge o) = a \vee o = a.$$

$$x \vee y = x \vee [a \vee (b \wedge x')]$$

$$= (x \vee a) \vee (b \wedge x')$$

$$= x \vee (b \wedge x')$$

$$= b \wedge (x \vee x') \quad [\text{as } b \geq x, L \text{ is modular}]$$

$$= b \wedge u$$

$$= b.$$

Hence  $y = a \vee (b \wedge x')$  is relative complement of  $x$  in  $[a, b]$  proving our assertion. ■

### 3.3 Distributive Lattice .

**Definition ( Distributive Lattice ) :** A lattice  $L$  is called a distributive lattice if

$$a \wedge (b \vee c) = (a \wedge b) \vee (a \wedge c) \quad \forall a, b, c \in L$$

**Example 3.3.1 :** The lattice  $(P(X), \subseteq)$  is a distributive lattice as

$$A \cap (B \cup C) = (A \cap B) \cup (A \cap C).$$

**Example 3.3.2 :** A chain is a distributive lattice .

Let  $a, b, c$  be any three members of a chain , then any two of these are comparable .

Suppose  $a \leq b, a \geq c, b \leq c$

then  $a \leq b \leq c \leq a \Rightarrow a = b = c.$

Thus  $a \wedge (b \vee c) = a = (a \wedge b) \vee (a \wedge c)$

If  $a \leq b, a \geq c, c \leq b$

then  $c \leq a, a \leq b, c \leq b$

thus  $a \wedge (b \vee c) = a \wedge b = a$

$$(a \wedge b) \vee (a \wedge c) = a \vee c = a.$$

\* \* A distributive lattice is always modular . Converse is not true as the lattice

$M_5$  given by

Fig. 3.4

is not distributive, but modular. Notice

$$a \wedge (b \vee c) = a, \text{ whereas}$$

$$(a \wedge b) \vee (a \wedge c) = o$$

**Theorem 3.3.1:** A lattice  $L$  is distributive if and only if

$$a \vee (b \wedge c) = (a \vee b) \wedge (a \vee c), \quad \forall a, b, c \in L.$$

**Proof:** Let  $L$  be distributive.

$$\begin{aligned} \text{Now } (a \vee b) \wedge (a \vee c) &= [(a \vee b) \wedge a] \vee [(a \vee b) \wedge c] \\ &= a \vee [(a \vee b) \wedge c] \quad [\text{absorption}] \\ &= a \vee [(a \wedge c) \vee (b \wedge c)] \\ &= [a \vee (a \wedge c)] \vee (b \wedge c) \\ &= a \vee (b \wedge c) \end{aligned}$$

Conversely, let  $a, b, c \in L$  be any three elements, then

$$\begin{aligned} (a \wedge b) \vee (a \wedge c) &= [(a \wedge b) \vee a] \wedge [(a \wedge b) \vee c] \\ &= a \wedge [(a \wedge b) \vee c] \\ &= a \wedge [(c \vee a) \wedge (c \vee b)] \\ &= [a \wedge (c \vee a)] \wedge (c \vee b) \\ &= a \wedge (c \vee b) \\ &= a \wedge (b \vee c) \end{aligned}$$

Hence  $L$  is distributive. ■

**Theorem 3.3.2:** A lattice  $L$  is distributive if and only if

$$(a \vee b) \wedge (b \vee c) \wedge (c \vee a) = (a \wedge b) \vee (b \wedge c) \vee (c \wedge a) \quad \forall a, b, c \in L$$

**Proof:** Let  $L$  be a distributive lattice.

$$\begin{aligned} (a \vee b) \wedge (b \vee c) \wedge (c \vee a) &= \{a \wedge [(b \vee c) \wedge (c \vee a)]\} \vee \\ &\quad \{b \wedge [(b \vee c) \wedge (c \vee a)]\}. \\ &= [\{a \wedge (c \vee a)\} \wedge (b \vee c)] \vee [\{b \wedge (b \vee c)\} \wedge (c \vee a)] \end{aligned}$$

$$\begin{aligned}
&= [a \wedge (b \vee c)] \vee [b \wedge (c \vee a)] \\
&= (a \wedge b) \vee (a \wedge c) \vee (b \wedge c) \vee (b \wedge a) \\
&= (a \wedge b) \vee (b \wedge c) \vee (c \wedge a).
\end{aligned}$$

Conversely, we first show that  $L$  is modular .

Let  $x, y, z$  be any three elements of  $L$ , with  $x \geq y$ .

$$\begin{aligned}
\text{Then } x \wedge (y \vee z) &= [x \wedge (x \vee z)] \wedge (y \vee z) \quad (\text{absorption}) \\
&= (x \vee y) \wedge (x \vee z) \wedge (y \vee z) \quad (x \geq y) \\
&= (x \vee y) \wedge (y \vee z) \wedge (z \vee x) \\
&= (x \wedge y) \vee (y \wedge z) \vee (z \wedge x) \\
&= (y \vee (y \wedge z)) \vee (z \wedge x) \quad (x \geq y) \\
&= y \vee (x \wedge z)
\end{aligned}$$

i. e.,  $L$  is modular .

Now for any  $a, b, c \in L$

$$\begin{aligned}
a \wedge (b \vee c) &= [a \wedge (a \vee c)] \wedge (b \vee c) \\
&= [a \wedge (a \vee b) \wedge (a \vee c)] \wedge (b \vee c) \\
&= a \wedge [(a \vee b) \wedge (b \vee c) \wedge (c \vee a)] \\
&= a \wedge [(a \wedge b) \vee (b \wedge c) \vee (c \wedge a)] \\
&= a \wedge [(b \wedge c) \vee ((a \wedge b) \vee (c \wedge a))]
\end{aligned}$$

Now using modularity,  $a \geq a \wedge b$ ,  $a \geq c \wedge a$  gives

$$a \geq (a \wedge b) \vee (c \wedge a) \text{ we get}$$

$$\begin{aligned}
a \wedge (b \vee c) &= [(a \wedge b) \vee (c \wedge a)] \vee [(b \wedge c) \wedge a] \\
&= (a \wedge b) \vee [(c \wedge a) \vee [(c \wedge a) \wedge b]] \\
&= (a \wedge b) \vee (c \wedge a)
\end{aligned}$$

Hence  $L$  is distributive . ■

**Theorem 3.3.3 :** Homomorphic image of a distributive lattice is distributive .

---

**Proof:** Let  $\theta : L \longrightarrow M$  be an onto homomorphism where  $L$  is a distributive lattice .

Let  $x, y, z \in M$  be any elements . Since  $\theta$  is onto,  $\exists a, b, c \in L$  s. t.,  $\theta(a) = x, \theta(b) = y, \theta(c) = z$

$$\begin{aligned}\text{Now } x \wedge (y \vee z) &= \theta(a) \wedge [\theta(b) \vee \theta(c)] \\ &= \theta(a) \wedge (\theta(b \vee c)) \\ &= \theta(a \wedge (b \vee c)) \\ &= \theta((a \wedge b) \vee (a \wedge c)) \\ &= \theta(a \wedge b) \vee \theta(a \wedge c) \\ &= (\theta(a) \wedge \theta(b)) \vee (\theta(a) \wedge \theta(c)) \\ &= (x \wedge y) \vee (x \wedge z).\end{aligned}$$

Shows  $M$  is distributive . ■

---

**“Boolean Algebras and Boolean Functions”**

**4.1 Introduction .**

A complemented distributive lattice is called a Boolean lattice . Let  $(A, \wedge, \vee, ')$  be a Boolean algebra . Expressions involving members of  $A$  and the operations  $\wedge, \vee$  and complementation are called Boolean expressions . Any function specifying these Boolean expressions is called a Boolean function . A Boolean function is said to be in disjunctive normal form ( DN form ) in  $n$  variables  $x_1, x_2, x_3, \dots, x_n$  if it can be written as join of terms of the type

$$f_1(x_1) \wedge f_2(x_2) \wedge f_3(x_3) \wedge \dots \wedge f_n(x_n) . \quad \text{where } f_i(x_i) = x_i$$

for all  $i = 1, 2, 3, \dots, n$  and no two terms are same .

**4.2 Boolean Lattices , Boolean Subalgebras .**

**Definition ( Boolean lattice ) :** A complemented distributive lattice is called a Boolean lattice .

Since compliments are unique in a Boolean lattice we can regard a Boolean lattice as an Boolean algebra with two binary operations  $\wedge$  and  $\vee$  and one unary operation  $'$  . Boolean lattices so considered are called Boolean algebras . In other words, by a Boolean Algebra , we mean a system consisting of a non empty set  $L$  together with two binary operations  $\wedge$  and  $\vee$  and a unary operation  $'$ , satisfying  $(\forall a, b, c \in L)$

$$(i) \quad a \wedge a = a, \quad a \vee a = a$$

$$(ii) \quad a \wedge b = b \wedge a, \quad a \vee b = b \vee a$$

$$(iii) \quad a \wedge (b \wedge c) = (a \wedge b) \wedge c, \quad a \vee (b \vee c) = (a \vee b) \vee c$$

$$(iv) \quad a \wedge (a \vee b) = a, \quad a \vee (a \wedge b) = a$$

$$(v) \quad a \wedge (b \vee c) = (a \wedge b) \vee (a \wedge c)$$

$$(vi) \quad \forall a \in L, \exists a' \in L, \text{ s.t., } a \wedge a' = o, a \vee a' = u$$

where  $o, u$  are elements of  $L$  satisfying

$$o \leq x \leq u \quad \forall x \in L$$

(  $a'$  will be unique and is the complement of  $a$  )

**Example 4.2.1 :** Let  $S$  be a non empty set , then  $( P ( S ) , \subseteq )$  we know from a distributive lattice and each element has a complement.

Thus

$( P ( S ) , \subseteq )$  is a Boolean lattice .

**Example 4.2.2 :** Let  $S =$  Set of factors of 30 , then  $L$  forms a Boolean lattice under divisibility .

**Example 4.2.3 :** Let  $A = \{ o, a, b, u \}$  . Define  $\wedge, \vee$  and complementation  $'$  by

Fig. 4.1

Then  $A$  forms a Boolean algebra under these operations

$$\wedge, \vee, ' .$$

**Definition ( Boolean subalgebra ) :** A sub algebra ( or a Boolean sub algebra ) is a non empty subset  $S$  of a Boolean algebra  $L$  s. t.,

$$a, b \in S \Rightarrow a \wedge b, a \vee b, a' \in S .$$

We thus realize that a sub algebra differs from a sublattice in as much as it is closed under complementation also . Notice that if  $[ a , b ]$  be an interval in a Boolean algebra  $L$  , where  $a > o$  , then  $[ a , b ]$  is a sub lattice of  $L$  , but is not a sub algebra as

$$\begin{aligned} a \in [ a , b ] &\Rightarrow a' \in [ a , b ] \\ &\Rightarrow a \wedge a' \in [ a , b ] \\ &\Rightarrow o \in [ a , b ] \end{aligned}$$

which is not possible as  $a > o$  .

Hence a Boolean sublattice may not be a Boolean sub algebra .

( The converse being , of course , true )

**Problem 4.2.1 :** Show that a non empty subset  $S$  of a Boolean algebra is a sub algebra if it is closed under  $\vee$  and complementation .

**Solution :** We need prove that for any  $a , b \in S$  ,  $a \wedge b \in S$

$$\text{Now } ( a \wedge b )' = a' \vee b' \in S$$

$$\Rightarrow ( a \wedge b ) = ( ( a \wedge b )' )' \in S$$

similarly , one can show that  $S$  would be a sub algebra if it is closed under  $\wedge$  and complementation . ■

**Theorem 4.2.2 :** In a Boolean algebra , the following results hold

$$( i ) ( a' )' = a$$

$$( ii ) ( a \wedge b )' = a' \vee b' \quad [ \text{De Morgan's law} ]$$

$$( iii ) ( a \vee b )' = a' \wedge b' \quad [ \text{De Morgan's law} ]$$

$$( iv ) a \leq b \Leftrightarrow a' \geq b'$$

$$( v ) a \leq b \Leftrightarrow a \wedge b' = o \Leftrightarrow a' \vee b = u$$

**Proof:** (i) Let  $(a')' = a''$ , then

$$a \wedge a' = 0, \quad a \vee a' = u$$

$$a' \wedge a'' = 0, \quad a' \vee a'' = u$$

$$\Rightarrow a \wedge a' = a'' \wedge a', \quad a \vee a' = a'' \vee a'$$

$$\Rightarrow a'' = a$$

(ii) We have  $(a \wedge b) \wedge (a' \vee b')$

$$= [(a \wedge b) \wedge a'] \vee [(a \wedge b) \wedge b']$$

$$= [(a \wedge a') \wedge b] \vee [a \wedge (b \wedge b')]$$

$$= [0 \wedge b] \vee [a \wedge 0]$$

$$= 0 \vee 0$$

$$= 0$$

$$(a \wedge b) \vee (a' \vee b') = (a' \vee b') \vee (a \wedge b)$$

$$= [(a' \vee b') \vee a] \wedge [(a' \vee b') \vee b]$$

$$= [(a' \vee a) \vee b'] \wedge [a' \vee (b' \vee b)]$$

$$= (u \vee b') \wedge (a' \vee u)$$

$$= u \wedge u$$

$$= u$$

Hence  $(a \wedge b)' = a' \vee b'$

(iii) Similar as (ii)

(iv)  $a \leq b \Rightarrow a = a \wedge b$

$$\Rightarrow a' = (a \wedge b)' = a' \vee b'$$

$$\Rightarrow b' \leq a'$$

$$b' \leq a' \Rightarrow b'' \geq a''$$

$$\Rightarrow b \geq a$$

$$(\forall) a \leq b \Rightarrow a \wedge b' \leq b \wedge b' \Rightarrow 0 \leq a \wedge b' \leq 0 \Rightarrow a \wedge b' = 0.$$

Again let  $a \wedge b' = 0$ .

$$\begin{aligned} \text{Then } a &= a \wedge u = a \wedge (b \vee b') = (a \wedge b) \vee (a \wedge b') \\ &= (a \wedge b) \vee 0 = (a \wedge b) \end{aligned}$$

$$\Rightarrow a \leq a \wedge b.$$

Second result follows similarly. ■

**Problem 4.2.3 :** If  $A, B, C$  lattices such that  $B \cong C$ , then

$$A \times B \cong A \times C$$

**Solution :** Let  $f: B \longrightarrow C$  be the given isomorphism.

Define  $\theta: A \times B \longrightarrow A \times C$ , s. t.,

$$\theta((a, b)) = (a, f(b))$$

then since  $\theta((a, b)) = \theta((c, d))$

$$\Leftrightarrow (a, f(b)) = (c, f(d))$$

$$\Leftrightarrow a = c, f(b) = f(d)$$

$$\Leftrightarrow a = c, b = d \text{ (} f \text{ being well defined 1-1 map)}$$

$$\Leftrightarrow (a, b) = (c, d)$$

We find  $\theta$  is a well defined 1-1 map.

Again, for any  $(x, y) \in A \times C$ , as  $y \in C$ ,  $f: B \longrightarrow C$  is onto,  $\exists b \in B$ , s. t.,  $f(b) = y$ .

Now  $\theta((x, b)) = (x, f(b)) = (x, y)$  and thus  $\theta$  is onto.

Finally,

$$\begin{aligned} \theta((a, b) \wedge (c, d)) &= \theta(a \wedge c, b \wedge d) = (a \wedge c, f(b \wedge d)) \\ &= (a \wedge c, f(b) \wedge f(d)) \\ &= (a, f(b)) \wedge (c, f(d)) \end{aligned}$$

$$= \theta((a, b)) \wedge \theta((c, d))$$

Similarly,  $\theta((a, b) \vee (c, d)) = \theta((a, b)) \vee \theta((c, d))$ .

Hence  $\theta$  is an isomorphism. ■

**Theorem 4.2.4 :** Let  $L$  be a relatively complemented lattice with least element  $o$ . Then any ideal of  $L$  can equal the Kernel corresponding to at most one congruence relation.

**Proof :** Let  $C$  be any congruence relation on  $L$ . Let  $a, b \in L$  be any two elements. Then  $a \wedge b \in [o, a \vee b]$  and as  $L$  is relatively complemented,  $a \wedge b$  has a complement, say  $p$ , relative to  $[o, a \vee b]$ . Thus

$$a \wedge b \wedge p = o, (a \wedge b) \vee p = a \vee b \text{ or } p \leq a \vee b$$

Let  $K_c$  be the kernel corresponding to  $C$ , then

$$K_c = \{x \in L \mid x C o\}$$

We claim  $(a \vee b) C (a \wedge b)$  if and only if  $p \in K_c$ .

Let  $(a \vee b) C (a \wedge b)$  then as  $p C p$

$$p \wedge (a \vee b) C p \wedge (a \wedge b) \Rightarrow p C o \Rightarrow p \in K_c$$

Again  $p \in K_c \Rightarrow p C o$

$$\Rightarrow p \vee (a \wedge b) C o \vee (a \wedge b) \text{ as } (a \wedge b) \vee (a \wedge b)$$

$$\Rightarrow (a \vee b) C (a \wedge b).$$

Hence  $(a \vee b) C (a \wedge b) \Leftrightarrow p \in K_c$

Then  $a C b \Leftrightarrow p \in K_c$

Suppose now  $I$  is any ideal of  $L$  such that it equals the Kernels  $K_{c1}$  and  $K_{c2}$  corresponding to two congruence relations  $C_1$  and  $C_2$  over  $L$ .

Then  $I = K_{c1}, I = K_{c2} \Rightarrow K_{c1} = K_{c2}$ .

Let  $a, b \in L$  be any elements, then  $p$  exists and

---

$$a C_1 b \Leftrightarrow p \in K_{c1} \Leftrightarrow p \in K_{c2} \Leftrightarrow a C_2 b$$

i. e.,  $C_1 = C_2$  which proves our assertion. ■

**Theorem 4.2.5 :** If  $L$  is a Boolean algebra then any ideal of  $L$  equals the Kernel corresponding to one and only one congruence relation over  $L$ .

**Proof :** Since  $L$  is distributive and has zero, then any ideal equals the Kernel corresponding to at least one congruence relation.

Again, since  $L$  is relatively complemented the ideal cannot equal Kernels corresponding to more than one congruence relation. Hence any ideal will equal Kernel corresponding to just one congruence relation. ■

### 4.3 Rings , Boolean Rings , Boolean Functions .

**Definition ( Ring ) :** A non-empty set  $R$  together with two binary operations , additions ( denoted “ + ” ) and multiplication ( denoted by “ . ” ) is called a ring if it is satisfied the following laws :

1. Associative law of addition :

$$(a + b) + c = a + (b + c) \quad \forall a, b, c \in R$$

2. Existence of additive identity zero :

$$\exists 0 \in R \Rightarrow a + 0 = 0 + a, \quad \forall a \in R$$

3. Existence of additive inverse :

$$a \in R \Rightarrow \exists -a \in R \Rightarrow a + (-a) = (-a) + a = 0, \quad \forall a \in R$$

4. Commutative law of addition :

$$a + b = b + a \quad \forall a, b \in R$$

5. Associative law of multiplication :

$$(a \cdot b) \cdot c = a \cdot (b \cdot c) \quad \forall a, b, c \in R$$

6. Distributive laws :

$$(i) \text{ Left : } a \cdot (b + c) = a \cdot b + a \cdot c \quad \forall a, b, c \in R$$

$$(ii) \text{ Right : } (a + b) \cdot c = a \cdot c + b \cdot c \quad \forall a, b, c \in R$$

**Definition ( Ring with unity ) :** A ring  $R$  is called a ring with unity if there exists an element  $1 \neq 0 \in R$  such that  $a \cdot 1 = 1 \cdot a = a$ ,  $\forall a \in R$  where  $1$  is called the multiplicative identity or multiplicative unity .

**Definition ( Commutative ring ) :** A ring  $R$  is called commutative ring if under the binary operation of multiplication  $a \cdot b = b \cdot a$   $\forall a, b \in R$  .

**Definition ( Ring with zero divisor ) :** A ring  $R$  is called with zero

divisors if there exists at least two elements  $a$  and  $b$  of  $R$  such that  $a \cdot b = 0$  where  $a \neq 0$  and  $b \neq 0$ .

**Definition ( Boolean ring ) :** A ring  $R$  is called a Boolean ring if

$$a^2 = a \quad \forall a \in R.$$

**Theorem 4.3.1 :** Every Boolean algebra is a Boolean ring with unity .

**Proof :** A Boolean ring is a ring in which  $x^2 = x \quad \forall x$ .

Let  $(A, \wedge, \vee, ')$  be a Boolean algebra .

Define two operations  $+$  and  $\cdot$  on  $A$  by

$$a \cdot b = a \wedge b$$

$$a + b = (a \wedge b') \vee (a' \wedge b) \quad a, b \in A$$

Then  $+$  and  $\cdot$  are clearly binary compositions on  $A$  .

To show that  $\langle A, +, \cdot \rangle$  forms a Boolean ring , we verify all the conditions in the definitions .

Let  $a, b, c \in A$  be any members .

$$\begin{aligned} a + b &= (a \wedge b') \vee (a' \wedge b) = (b \wedge a') \vee (b' \wedge a) = b + a \\ (a + b) + c &= [(a + b) \wedge c'] \vee [(a + b)' \wedge c] \\ &= [\{(a \wedge b') \vee (a' \wedge b)\} \wedge c'] \vee [\{(a \wedge b') \vee (a' \wedge b)\}' \wedge c] \\ &= [(a \wedge b' \wedge c') \vee (a' \wedge b \wedge c')] \vee [(a \wedge b')' \wedge (a' \wedge b)' \wedge c] \\ &= [(a \wedge b' \wedge c') \vee (a' \wedge b \wedge c')] \vee [(a' \vee b) \wedge (a \vee b') \wedge c] \\ &= [(a \wedge b' \wedge c') \vee (a' \wedge b \wedge c')] \vee [\{(a' \vee b) \wedge a\} \\ &\quad \vee \{(a' \vee b) \wedge b'\} \wedge c] \\ &= [(a \wedge b' \wedge c') \vee (a' \wedge b \wedge c')] \\ &\quad \vee [\{(a' \wedge a) \vee (b \wedge a) \vee (a' \wedge b') \vee (b \wedge b')\} \wedge c] \\ &= (a \wedge b' \wedge c') \vee (a' \wedge b \wedge c') \vee [\{(b \wedge a) \vee (a' \wedge b')\} \wedge c] \\ &= (a \wedge b' \wedge c') \vee (a' \wedge b \wedge c') \vee [(b \wedge a \wedge c) \vee (a' \wedge b' \wedge c)] \end{aligned}$$

$$= (a \wedge b' \wedge c') \vee (a' \wedge b \wedge c') \vee (b \wedge a \wedge c) \vee (a' \wedge b' \wedge c)$$

Since the resulting value is symmetric in  $a, b, c$  it will also be equal to  $(b + c) + a = a + (b + c)$  (by commutativity of  $+$ )

Hence  $+$  is associative.

$$\text{Again } a + 0 = (a \wedge u) \vee (a' \wedge 0) = a = 0 + a.$$

$$\text{Also } a + a = (a \wedge a') \vee (a' \wedge a) = 0.$$

Thus  $(A, +)$  forms an abelian group.

Since  $a \cdot b = a \wedge b$  and  $\wedge$  is commutative and associative.

We find  $\cdot$  is also commutative and associative.

$$\begin{aligned} \text{Again, } a(b + c) &= a \wedge (b + c) = a \wedge [(b \wedge c') \vee (b' \wedge c)] \\ &= (a \wedge b \wedge c') \vee (a \wedge b' \wedge c) \end{aligned}$$

$$\begin{aligned} a b + a c &= (a \wedge b) + (a \wedge c) \\ &= [(a \wedge b) \wedge (a \wedge c)'] \vee [(a \wedge b)' \wedge (a \wedge c)] \\ &= [(a \wedge b) \wedge (a' \wedge c')] \vee [(a' \vee b') \wedge (a \wedge c)] \\ &= [(a \wedge b \wedge a') \vee (a \wedge b \wedge c') \vee (a \wedge c \wedge a') \\ &\quad \vee (a \wedge c \wedge b')] \\ &= (a \wedge b \wedge c') \vee (a \wedge b' \wedge c) \end{aligned}$$

$$\text{Hence } a(b + c) = a b + a c$$

$$\text{Similarly, } (b + c)a = b a + c a.$$

$$\text{Finally, since } a \cdot u = a \wedge u = a = u \wedge a = u \cdot a.$$

We find  $(A, +, \cdot)$  forms a commutative ring with unity  $u$ .

$$\text{Also as } a \cdot a = a \wedge a = a \quad \forall a$$

we gather that  $A$  forms a Boolean ring. ■

**Theorem 4.3.2 :** Every Boolean ring with unity is a Boolean algebra.

**Proof :** Let  $\langle A, +, \cdot \rangle$  be a Boolean ring with unity.

We defined two operations  $\wedge$  and  $\vee$  on  $A$  by

$$a \wedge b = a \cdot b$$

$$a \vee b = a + b + a b$$

Then since  $\cdot$  is commutative (a Boolean ring is commutative) and associative we find  $\wedge$  is commutative and associative.

$$\text{Again } a \vee a = a + a + a a = (a + a) a = 0 + a$$

(In a Boolean Ring  $a + a = 0 \quad \forall a$ , where 0 is zero of the ring)

$$\text{Also } a \vee b = a + b + a b = b + a + b a = b \vee a$$

$$\begin{aligned} (a \vee b) \vee c &= (a \vee b) + c + (a \vee b) \cdot c \\ &= (a + b + a b) + c + (a + b + a b) c \\ &= a + b + a b + c + a c + b c + a b c \end{aligned}$$

Since,  $a \vee (b \vee c) = (b \vee c) \vee a$  (by commutativity of  $\vee$ )

By symmetry,  $(b \vee c) \vee a = b + c + b c + a + b a + c a + a b c$

Hence  $\vee$  is associative.

Finally to check absorption, we find

$$\begin{aligned} a \wedge (a \vee b) &= a (a + b + a b) \\ &= a^2 + a b + a^2 b \\ &= a + a b + a b \\ &= a + 2 a b \\ &= a \end{aligned}$$

(as  $x + x = 0 \quad \forall x$ )

$$\begin{aligned} a \vee (a \wedge b) &= a \vee a b = a + a b + a a b \\ &= a + 2 a b \\ &= a \end{aligned}$$

Thus  $A$  is a lattice.

We leave distributively for the reader to verify . Let now  $a \in A$  be any element . We show it has a complement , namely ,  $a + 1$  ( where 1 is unity of ring  $A$  )

$$\begin{aligned} \text{Now } a \wedge (a + 1) &= a(a + 1) \\ &= a^2 + a \\ &= a + a \\ &= 0 \end{aligned}$$

$$\begin{aligned} a \vee (a + 1) &= a + a + 1 + a(a + 1) \\ &= 2a + 1 + a + a \\ &= 1 + 2a \\ &= 1 \end{aligned}$$

Showing that  $a' = a + 1$

Notice , in the ring  $A$ ,  $0 \cdot a = 0 \quad \forall a \in A$   
( 0 being zero of ring )

$$\Rightarrow 0 \wedge a = 0 \quad \forall a \in A .$$

$$\text{Again } 1 \cdot a = a \quad \forall a$$

$$\text{i. e., } 1 \wedge a = a \quad \forall a \in A$$

Thus 0 and 1 are least and greatest elements of the lattice  $A$  . ■

**Definition ( Boolean function ) :** Let  $(A, \wedge, \vee, ')$  be a Boolean algebra . Expressions involving members of  $A$  and the operations  $\wedge, \vee$  and complementation are called Boolean expressions or Boolean polynomials. For example ,  $x \vee y'$ ,  $x$ ,  $x \wedge 0$  etc. are all Boolean expressions . Any function specifying these Boolean expressions is called a Boolean function. Thus if  $f(x, y) = x \wedge y$  then  $f$  is the Boolean function and  $x \wedge y$  is the Boolean expression ( or value of the function  $f$  ) . Since it is

---

normally the functional value ( and not the function ) that we are interested in , we call these expressions the Boolean functions .

#### 4.4 Disjunctive normal forms , Complete Disjunctive normal forms

**Definition ( Disjunctive normal form ) :** A Boolean function

( expression ) is said to be in disjunctive normal form

( DN form ) in  $n$  variables  $x_1, x_2, x_3, \dots, x_n$  if it can be written as join of terms of the type

$$f_1(x_1) \wedge f_2(x_2) \wedge f_3(x_3) \wedge \dots \wedge f_n(x_n)$$

where  $f_i(x_i) = x_i$  or  $x'_i$ , for all  $i = 1, 2, 3, \dots, n$

and no two terms are same . Also , 1 and 0 are said to be in disjunctive normal form .

**Definition ( Minterms or minimal polynomials ) :** The terms of type

$$f_1(x_1) \wedge f_2(x_2) \wedge f_3(x_3) \wedge \dots \wedge f_n(x_n)$$

are called minterms or minimal polynomials . ( A normal form is also called a canonical form ) .

For instance ,  $(x \wedge y \wedge z') \vee (x' \wedge y' \wedge z) \vee (x' \wedge y \wedge z)$  is in disjunctive normal form ( in three variables ) and each of the brackets is a minterms .

**Problem 4.4.1 :** Put the function

$$f = [(x \wedge y)'] \vee z' ] \wedge (x' \vee z)' \text{ in the DN form .}$$

**Solution :** We have

$$\begin{aligned} f &= [(x' \vee y') \vee z' ] \wedge (z' \wedge x'') \\ &= (x' \vee y \vee z') \wedge (z' \wedge x) \\ &= (x' \wedge z' \wedge x) \vee (y \wedge z' \wedge x) \vee (z' \wedge z' \wedge x) \\ &= 0 \vee (x \wedge y \wedge z') \vee (x \wedge z') \\ &= (x \wedge y \wedge z') \vee [(x \wedge z') \wedge (y \vee y')] \text{ ( Note this step )} \\ &= (x \wedge y \wedge z') \vee [(x \wedge z' \wedge y) \vee (x \wedge z' \wedge y')] \\ &= (x \wedge y \wedge z') \vee (x \wedge y' \wedge z') . \quad \blacksquare \end{aligned}$$

**Definition ( Complete disjunctive normal form ) :** If a disjunctive normal form in  $n$  variables contains all the  $2^n$  minterms then it is called the complete disjunctive normal form in  $n$  variables .

**Example 4.4.1 :** For example ,  $(x \wedge y) \vee (x' \wedge y) \vee (x \wedge y') \vee (x' \wedge y')$  is the complete disjunctive normal form in two variables.

**Problem 4.4.2 :** Write the function  $x \vee y'$  in the disjunctive normal form in three variables  $x, y, z$  .

**Solution :** We have

$$\begin{aligned} x \vee y' &= [x \wedge (y \vee y') \wedge (z \vee z')] \vee [y' \wedge (x \vee x') \wedge (z \vee z')] \\ &= [ \{ (x \wedge y) \vee (x \wedge y') \} \wedge (z \vee z') ] \\ &\quad \vee [ \{ (y' \wedge x) \vee (y' \wedge x') \} \wedge (z \vee z') ] \\ &= (x \wedge y \wedge z) \vee (x \wedge y \wedge z') \vee (x \wedge y' \wedge z) \\ &\quad \vee (x \wedge y' \wedge z') \vee (y' \wedge x \wedge z) \vee (y' \wedge x \wedge z') \\ &\quad \vee (y' \wedge x' \wedge z) \vee (y' \wedge x' \wedge z') . \\ &= (x \wedge y \wedge z) \vee (x \wedge y \wedge z') \vee (x \wedge y' \wedge z) \\ &\quad \vee (x \wedge y' \wedge z') \vee (x' \wedge y' \wedge z) \vee (x' \wedge y' \wedge z') . \blacksquare \end{aligned}$$

**Problem 4.4.3 :** Find the Boolean expression for the function  $f$  given by

$$f(x, y, z) = \begin{cases} 1 & \text{When } x=z=1, y=0 \\ & x=1, y=z=0 \\ 0 & \text{otherwise} \end{cases}$$

**Proof :** The function is specified by the minterms

$$(x \wedge y' \wedge z) \text{ and } (x \wedge y' \wedge z')$$

i.e., the function in the DN form is

$$(x \wedge y' \wedge z) \vee (x \wedge y' \wedge z') \quad \blacksquare$$

**Example 4.4.2 :** Let  $A = \{ 0, 1 \}$  and  $f: A^2 \longrightarrow A$ , be defined by

$$f(x, y) = (x \wedge y) \vee (x' \wedge y) \vee (x \wedge y') \vee (x' \wedge y')$$

i.e.,  $f$  is in complete DN form . We calculate all values of

$$f(x, y), \quad x, y \in A .$$

$$\text{Now } f(0, 0) = (0 \wedge 0) \vee (1 \wedge 0) \vee (0 \wedge 1) \vee (1 \wedge 1) = 1$$

$$f(1, 0) = (1 \wedge 0) \vee (0 \wedge 0) \vee (1 \wedge 1) \vee (0 \wedge 1) = 1$$

$$f(0, 1) = (0 \wedge 1) \vee (1 \wedge 1) \vee (0 \wedge 0) \vee (1 \wedge 0) = 1$$

$$f(1, 1) = (1 \wedge 1) \vee (0 \wedge 1) \vee (1 \wedge 0) \vee (0 \wedge 0) = 1$$

$$(\text{Note } x=0 \Leftrightarrow x'=1)$$

We thus notice that in each case , one minterm is  $1 \wedge 1 = 1$  and all others are zero . Also the resulting value of  $f(x, y)$  is always 1.

If we go through similar process , with a function  $f$  which is in complete DN form in three variables  $x, y, z$  we will get the same result . we can generalize this result .

**Example 4.4.3 :** Let  $A = \{ 0, 1 \}$  and  $f: A^3 \longrightarrow A$  be the function defined by  $f(x, y, z) = x \wedge (y \vee z)$ , then the functional values of  $f$  are given by

$$f(0, 0, 0) = 0 \wedge (0 \vee 0) = 0$$

$$f(1, 0, 0) = 1 \wedge (0 \vee 0) = 0$$

$$f(0, 1, 0) = 0 \wedge (1 \vee 0) = 0$$

$$f(0, 0, 1) = 0 \wedge (0 \vee 1) = 0$$

$$f(1, 1, 0) = 1 \wedge (1 \vee 0) = 1$$

$$f(1, 0, 1) = 1 \wedge (0 \vee 1) = 1$$

$$f(0, 1, 1) = 0 \wedge (1 \vee 1) = 0$$

$$f(1, 1, 1) = 1 \wedge (1 \vee 1) = 1$$

which we sometimes write in the tabular form as

x	y	z	f(x, y, z)
0	0	0	0
1	0	0	0
0	1	0	0
0	0	1	0
1	1	0	1
1	0	1	1
0	1	1	0
1	1	1	1

**Problem 4.4.4.:** Find the Boolean expression that defines the function  $f$  given by

$$f(0, 0, 0) = 0$$

$$f(0, 1, 0) = 1$$

$$f(0, 0, 1) = 0$$

$$f(0, 1, 1) = 0$$

$$f(1, 0, 0) = 1$$

$$f(1, 0, 1) = 1$$

$$f(1, 1, 0) = 0$$

$$f(1, 1, 1) = 1$$

**Solution :** We consider those values of  $f(x, y, z)$  which are equal to 1. The minterms corresponding to  $f(0, 1, 0)$ ,  $f(1, 0, 0)$ ,  $f(1, 0, 1)$  and  $f(1, 1, 1)$  will be

$$(x' \wedge y \wedge z'), (x \wedge y' \wedge z'), (x \wedge y' \wedge z), (x \wedge y \wedge z)$$

Hence the function in DN form is

$$f(x, y, z) = (x' \wedge y \wedge z') \vee (x \wedge y' \wedge z') \vee \\ (x \wedge y' \wedge z) \vee (x \wedge y \wedge z)$$

which can be simplified

$$\begin{aligned} &= (x' \wedge y \wedge z') \vee x \wedge [(y' \wedge z') \vee (y' \wedge z) \vee (y \wedge z)] \\ &= (x' \wedge y \wedge z') \vee x \wedge [\{y' \wedge (z' \vee z)\} \vee (y \wedge z)] \\ &= (x' \wedge y \wedge z') \vee x \wedge [y' \vee (y \wedge z)] \\ &= (x' \wedge y \wedge z') \vee x \wedge [(y' \vee y) \wedge (y' \vee z)] \\ &= (x' \wedge y \wedge z') \vee x \wedge (y' \vee z) \\ &= (x' \wedge y \wedge z') \vee [(x \wedge y') \vee (x \wedge z)]. \quad \blacksquare \end{aligned}$$

**Example 4.4.4 :** Complete DN form in 2 variable is

$$(x \wedge y) \vee (x' \wedge y) \vee (x \wedge y') \vee (x' \wedge y')$$

Let  $f = (x \wedge y)$  [ any one DN form ]

then  $f' = (x \wedge y)' = x' \vee y'$

$$\begin{aligned} &= [x' \wedge (y \vee y')] \vee [y' \wedge (x \vee x')] \\ &= (x' \wedge y) \vee (x' \wedge y') \vee (y' \wedge x) \vee (y' \wedge x') \\ &= (x' \wedge y) \vee (x \wedge y') \vee (x' \wedge y'). \end{aligned}$$

Thus what we gather from here is that if we pick up any DN form from the complete DN form then complement of that DN form will contain the 'left out' terms in the complete DN form.

Take for instance,  $p = (x \wedge y) \vee (x' \wedge y)$

$$\begin{aligned} \text{then } p' &= [(x \wedge y) \vee (x' \wedge y)]' \\ &= (x \wedge y)' \wedge (x' \wedge y)' \end{aligned}$$

$$\begin{aligned}
 &= (x' \vee y') \wedge (x \vee y') \\
 &= (x \wedge x') \vee y' \\
 &= y' \\
 &= y' \wedge (x \vee x') \\
 &= (y' \wedge x) \vee (y' \wedge x')
 \end{aligned}$$

the 'left out' terms in the complete DN form.

**Problem 4.4.5 :** In a Boolean algebra, show that

$$f(x, y) = [x \wedge f(1, y)] \vee [x' \wedge f(0, y)]$$

**Solution :** We know that any function  $f$  (in 2 variables) in complete

DN form is

$$\begin{aligned}
 f(x, y) &= (x \wedge y) \vee (x' \wedge y) \vee (x \wedge y') \vee (x' \wedge y') \\
 &= [x \wedge (y \vee y')] \vee [x' \wedge (y \wedge y')] \text{ ----- (1)}
 \end{aligned}$$

Put  $x = 1, x' = 0$  and we get

$$\begin{aligned}
 f(1, y) &= [1 \wedge (y \vee y')] \vee [0 \wedge (y \wedge y')] \\
 &= y \vee y'
 \end{aligned}$$

Again, by putting  $x = 0, x' = 1$  we get

$$f(0, y) = y \vee y'$$

Thus (1) gives

$$f(x, y) = [x \wedge f(1, y)] \vee [x' \wedge f(0, y)] \quad \blacksquare$$

### 4.5 Conjunctive Normal Forms .

**Definition ( Conjunctive Normal Form ) :** A Boolean function  $f$  is said

to be in **conjunctive normal form** ( CN form ) in  $n$  variables

$x_1, x_2, x_3, \dots, x_n$

if  $f$  is meet of terms of the type

$$f_1(x_1) \vee f_2(x_2) \vee \dots \vee f_n(x_n)$$

where  $f_i(x_i) = x_i$  or  $x_i'$  for all  $i = 1, 2, 3, \dots, n$

and no two terms are same . Also 0 and 1 are said to be in CN form .

**Problem 4.5.1 :** Put the function

$$f = [(x \wedge y') \vee z'] \wedge (x' \vee z)' \text{ in the CN form .}$$

**Solution :** We have

$$\begin{aligned} f &= [(x' \vee y) \vee z'] \wedge (x \wedge z') \\ &= (x' \vee y \vee z') \wedge [(x \wedge z') \vee (y \wedge y')] \\ &= (x' \vee y \vee z') \wedge \{ [(x \wedge z') \vee y] \wedge [(x \wedge z') \vee y'] \} \\ &= (x' \vee y \vee z') \wedge [(x \vee y) \wedge (z' \vee y) \wedge \\ &\quad (x \vee y') \wedge (z' \vee y')] \\ &= (x' \vee y \vee z') \wedge [ \{ x \vee y \vee (z \wedge z') \} \wedge \\ &\quad \{ (z' \vee y) \vee (x \wedge x') \} \wedge \{ (x \vee y') \vee (z \wedge z') \} \wedge \\ &\quad \{ (z' \vee y') \vee (x \wedge x') \} ] \\ &= (x' \vee y \vee z') \wedge (x \vee y \vee z) \wedge (x \vee y \vee z') \wedge \\ &\quad (z' \vee y \vee x) \wedge (z' \vee y \vee x') \wedge (x \vee y' \vee z) \wedge \\ &\quad (x \vee y' \vee z') \wedge (z' \vee y' \vee x) \wedge (z' \vee y' \vee x') \\ &= (x \vee y \vee z) \wedge (x' \vee y \vee z') \wedge (x \vee y \vee z') \\ &\quad \wedge (x \vee y' \vee z) \wedge (x \vee y' \vee z') \wedge (x' \vee y' \vee z') . \blacksquare \end{aligned}$$

**Problem 4.5.2 :** Put the function  $x \wedge (y \vee z)$  in the CN form .

$$\begin{aligned}
 \text{Solution : } x \wedge (y \vee z) &= [x \vee (y \wedge y')] \wedge [(y \vee z) \vee (x \wedge x')] \\
 &= (x \vee y) \wedge (x \vee y') \wedge (y \vee z \vee x) \wedge (y \vee z \vee x') \\
 &= (x \vee y) \vee (z \wedge z') \wedge (x \vee y') \vee (z \wedge z') \wedge (y \vee z \vee x) \\
 &\quad \wedge (x' \vee y \vee z) \\
 &= (x \vee y \vee z) \wedge (x \vee y \vee z') \wedge (x \vee y' \vee z) \wedge (x \vee y' \vee z') \\
 &\quad \wedge (x \vee y \vee z) \wedge (x' \vee y \vee z) \\
 &= (x \vee y \vee z) \wedge (x \vee y \vee z') \wedge (x \vee y' \vee z) \wedge (x \vee y' \vee z') \\
 &\quad \wedge (x' \vee y \vee z). \quad \blacksquare
 \end{aligned}$$

**Problem 4.5.3 :** Find the DN form of the function whose CN form is

$$\begin{aligned}
 f &= (x \vee y \vee z) \wedge (x \vee y \vee z') \wedge (x \vee y' \vee z) \wedge \\
 &\quad (x \vee y' \vee z') \wedge (x' \vee y \vee z)
 \end{aligned}$$

**Solution :** We know  $f = (f')'$ . Thus

$$\begin{aligned}
 f &= [ \{ (x \vee y \vee z) \wedge (x \vee y \vee z') \wedge (x \vee y' \vee z) \wedge \\
 &\quad (x \vee y' \vee z') \wedge (x' \vee y \vee z) \} ]' \\
 &= [(x \vee y \vee z)' \vee (x \vee y \vee z')' \vee (x \vee y' \vee z)' \vee \\
 &\quad (x \vee y' \vee z')' \vee (x' \vee y \vee z)']' \quad (\text{by De Morgan's law}) \\
 &= [(x' \wedge y' \wedge z') \vee (x' \wedge y' \wedge z) \vee (x' \wedge y \wedge z') \vee \\
 &\quad (x' \wedge y \wedge z) \vee (x \wedge y' \wedge z')]']' \quad (\text{by De Morgan's law}) \\
 &= (x \wedge y \wedge z) \vee (x \wedge y' \wedge z) \vee (x \wedge y \wedge z'). \quad \blacksquare
 \end{aligned}$$

Note : By similar steps we can find the CN form of a function from its DN form

**Problem 4.5.4 :** Find the CN form of the function

$$f = (x \wedge (y' \vee z)) \vee z' \text{ and then find its DN form from it .}$$

$$\begin{aligned}
 \text{Solution : } \quad f &= (x \wedge (y' \vee z)) \vee z' \\
 &= (x \vee z') \wedge ((y' \vee z) \vee z') \\
 &= x \vee z' \\
 &= (x \vee z') \vee (y \wedge y') \\
 &= (x \vee y \vee z') \wedge (x \vee y' \vee z')
 \end{aligned}$$

$$\begin{aligned}
 \text{Now } f = (f')' &= [\{(x \vee y \vee z') \wedge (x \vee y' \vee z')\}]' \\
 &= [(x \vee y \vee z')' \vee (x \vee y' \vee z')]' \\
 &= [(x' \wedge y' \wedge z) \vee (x' \wedge y \wedge z)]' \\
 &= (x \wedge y \wedge z) \vee (x' \wedge y \wedge z') \vee (x \wedge y \wedge z') \\
 &\quad \vee (x \wedge y' \wedge z) \vee (x \wedge y' \wedge z') \vee (x' \wedge y' \wedge z')
 \end{aligned}$$

If we wish, we can get DN form independently, as

$$\begin{aligned}
 f = x \vee z' &= [x \wedge (y \vee y')] \vee [z' \wedge (x \vee x')] \\
 &= (x \wedge y) \vee (x \wedge y') \vee (z' \wedge x) \vee (z' \wedge x') \\
 &= (x \wedge y) \wedge (z \vee z') \vee (x \wedge y') \wedge (z \vee z') \vee \\
 &\quad (z' \wedge x) \wedge (y \vee y') \vee (z' \wedge x') \wedge (y \vee y') \\
 &= (x \wedge y \wedge z) \vee (x \wedge y \wedge z') \vee (x \wedge y' \wedge z) \\
 &\quad \vee (x \wedge y' \wedge z') \vee (z' \wedge x \wedge y) \vee (z' \wedge x \wedge y') \\
 &\quad \vee (z' \wedge x' \wedge y) \vee (z' \wedge x' \wedge y') \\
 &= (x \wedge y \wedge z) \vee (x \wedge y \wedge z') \vee (x \wedge y' \wedge z) \vee \\
 &\quad (x \wedge y' \wedge z') \vee (x' \wedge y \wedge z') \vee (x' \wedge y \wedge z). \blacksquare
 \end{aligned}$$
